Inserts are sold separately. * Sizes ø160 mm and above do not have coolant holes.

For securing the ø80mm and ø100mm cutters to the arbors marked with *, use a JIS B1176 hexagonal socket bolt (ø80: M12 x 30 to 35mm, ø100: M16 x 40 to 45mm).

Note The cutting conditions above are a guide. Actual conditions will need to be adjusted according to machine rigidity, work clamp rigidity, depth of cut and other factors.

N·m Recommended Tightening Torque (N·m)

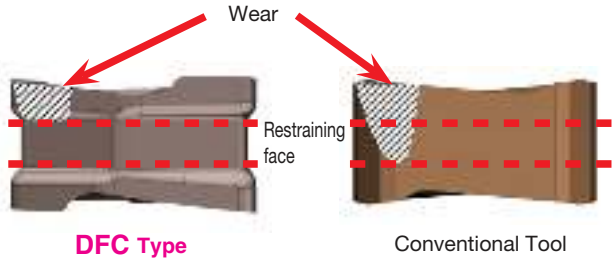
■ General Features

The high-efficiency general-purpose SEC-Sumi Dual Mill DFC Type has a unique insert shape with both excellent sharpness and cutting edge strength, enabling it to be used for a wider range of applications from high-efficiency machining through to finishing.
Further expansion of the shoulder milling GS Type chipbreaker, suitable for a wide range of applications.

■ Features

Unique insert shape delivers sharp cutting performance and cutting edge strength

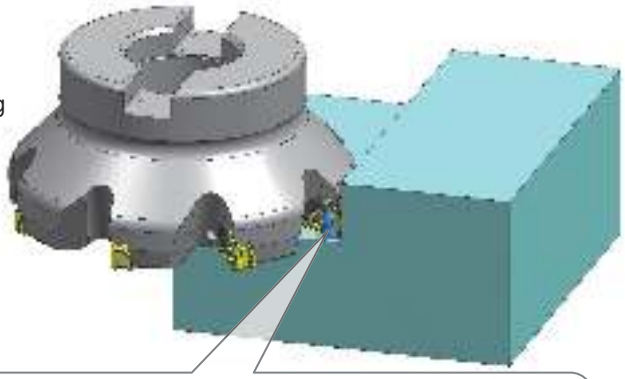


Flank wear of inserts for DFC Type does not reach the restraining face and thus mounting accuracy does not suffer.

The 90° cutting edge angle is suitable for both face milling and shoulder milling

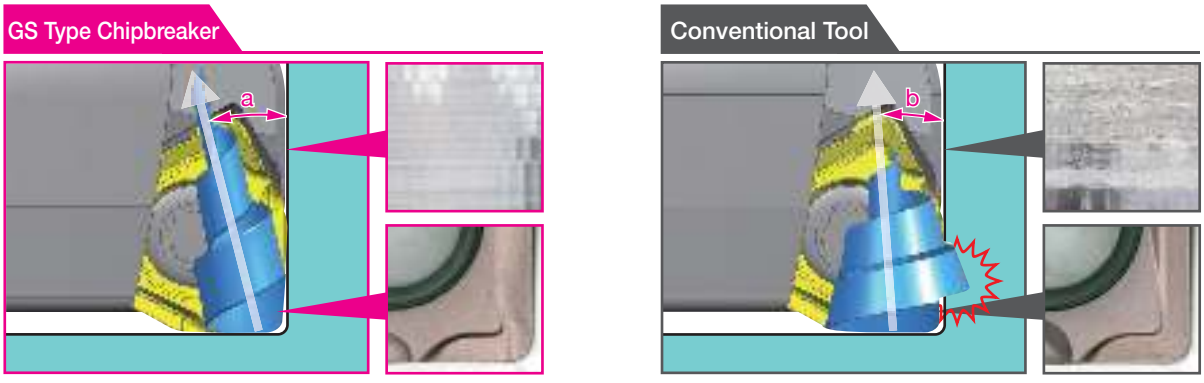
GS Type Chipbreaker for Shoulder Milling

· Excellent chip control
· Suppresses machined surface deterioration due to chip re-cutting



Part Material: 1050, Tool: ø4.000"
Cutting Conditions: v_c = 656 SFM, f_z = 0.008 IPT, a_e = 1.97", a_p = 0.12" x 6 passes, Dry

Chip generation image and machined surface comparison

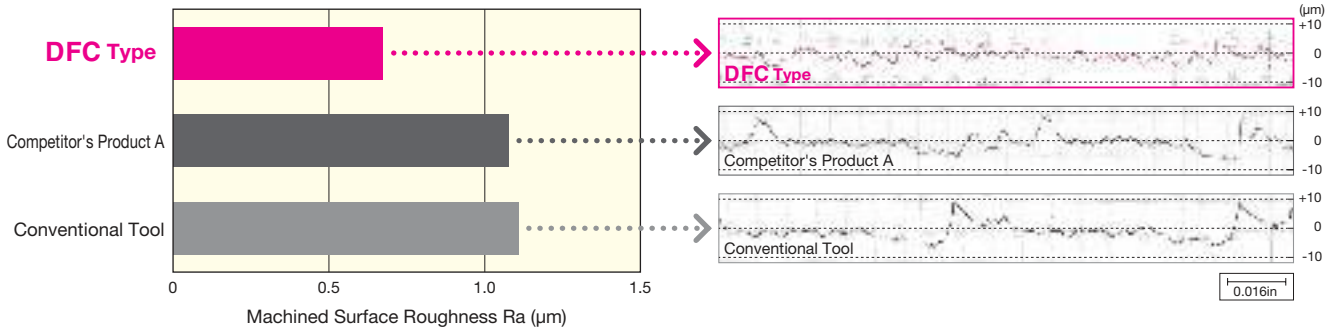


Chip flow direction control (a > b) ⟶ chip re-cutting suppressed

■ Cutting Performance

Face Milling

(1) Machined Surface Roughness Better than competitors' products



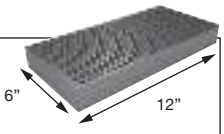
Part Material: 1050 Tool: DFC 09100RS Insert: XNMU 060608PNER-G Grade: ACP200 Cutting Conditions: v_c = 656 SFM, f_z = 0.008 IPT, a_p = 0.12", a_e = 3.35" Dry

(2) Cutting edge strength: Cutting edge damage during heavy interrupted cutting
Cutting edge strength surpassing competitors' double-sided cutters

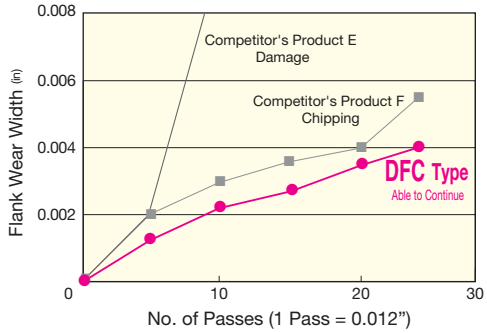
	f_z(IPT)		
	0.012	0.016	0.020
DFC Type	○	○	○
Competitor's Product B (Double-sided, 6 Corners)	○	Damage (Midway through 2 passes)	
Competitor's Product C (Double-sided, 6 Corners)	Damage (Midway through 3 passes)		
Competitor's Product D (Double-sided vertical)	Damage (Midway through 3 passes)		

(Cutting Distance: 0.9m)

Part Material: 1050 (With Holes)
Tool: DFC 09100RS
Insert: XNMU 060608PNER-G Grade: ACP300
Cutting Conditions: v_c = 492 SFM a_p = 0.12", a_e = 1.97" Dry



(3) Wear resistance: Achieves long tool life thanks to excellent wear resistance

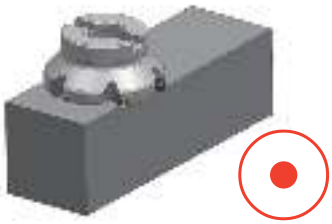


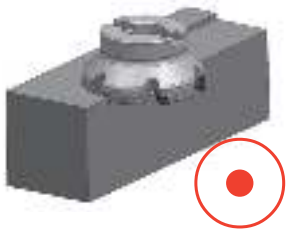
Comparison of cutting edge damage

Work Material: 1050 Tool: DFC 09100RS Insert: XNMU 060608PNER-G Grade: ACP200 Cutting Conditions: v_c = 656 SFM, f_z = 0.008 IPT, a_p = 0.12", a_e = 3.35" Dry

■ Applications and Recommended Chipbreakers

Face Milling	Shoulder Milling	Side Milling
G	GS	G/GS





Guidelines for Shoulder Milling Conditions

Radial Direction Maximum Depth of Cut
G Type: $a_e \leq 10\%$ of cutter diameter
GS Type: $a_e \leq 50\%$ of cutter diameter

Recommended Axial Depth of Cut $a_p = 0.120$"

Recommended Feed Rate $f_z \leq 0.008$ IPT
(for general steel)

⚠ Applications which are not applicable

Helical Milling

Ramping

■ Insert Mounting Precautions

Prevent gaps from occurring

No Gap

Gap

Place the insert face flat on to the cutter's insert pocket and tighten the flat screw with the recommended torque.

■ Insert Grade

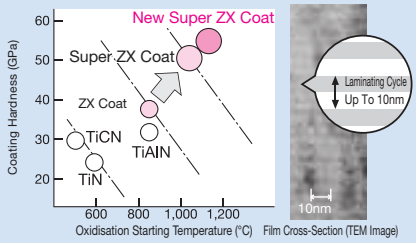
Lineup of Steel Milling Grades ACP100/ACP200/ACP300, Stainless Steel Milling Grades ACM200/ACM300, Cast Iron Milling Grades ACK200/ACK300 and more for a wide range of materials.

Part Material	Finishing to Light Cutting	Medium Cutting	Rough to Heavy Cutting
P Steel	ACP100 (C)	ACP200 (P)	ACP300 (P)
M Stainless Steel	ACM200 (C)	ACM300 (P)	
K Cast Iron	ACK200 (C)	ACK300 (P)	
S Exotic Alloy	ACM200 (C)	ACM300 (P)	

The letters "C" and "P" at the end of each grade indicate the coating type.
(C): CVD (P): PVD

(P) ACP200/ACP300/ACK300/ACM300

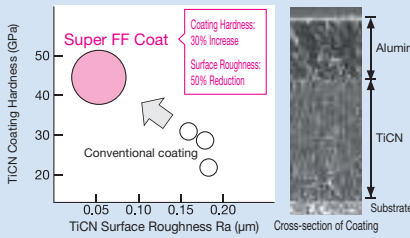
NEW SUPER ZX COAT



- Compared to conventional tools, the coating hardness has been increased by 40% and the oxidation starting temperature has been increased by 200°C
- Enables more than 1.5 times the machining speed and efficiency of conventional tools
- Achieves more than double the tool life of conventional tools

(C) ACP100/ACK200/ACM200

SUPER FF COAT



- Achieves excellent chipping resistance with smooth coating and our coating stress control technology
- High-speed, high-efficiency machining at a level more than 1.5 times higher than conventional tools is possible with a high hardness coating layer
- Achieves more than double the tool life of conventional tools

Note The cutting conditions above are a guide. Actual conditions will need to be adjusted according to machine rigidity, work clamp rigidity, depth of cut and other factors.

For shoulder milling, the GS Type breaker is recommended. Use at $a_e \leq 50\%$ of cutter diameter and $f_z \leq 0.008$ IPT.

N·m Recommended Tightening Torque (N·m) ● mark: Standard stocked item (new product/expanded item)

■ Features

- Excellent Machined Surface Quality

  Employs ground insert for high accuracy to produce excellent machined surface quality.

- Cutting Edge Designed for High Cutting Edge Strength and Sharpness

  Provides tangential insert and optimized cutting edge shape to achieve both high cutting edge strength and sharpness.

- Wide Ranging Product Lineup

  An enhanced lineup of grades is available in addition to 2 types of insert sizes and 3 types of chipbreakers.
  Can be used for various machining applications.

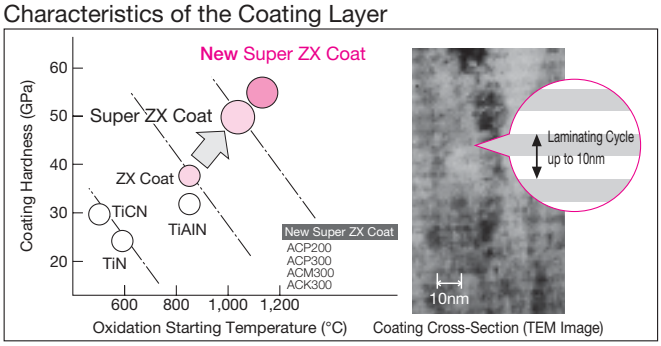
■ Coating Features

Super ZX Coat
(PVD: Physical Vapor Deposition)

Employs our super multi-layered New Super ZX Coat, which utilizes our proprietary thin-layer coating technology and advanced nanotechnology. The coating consists of thousands of alternating, nanometer-thin (1 nanometer = 1 billionth of a meter) layers

Characteristics of the Coating Layer

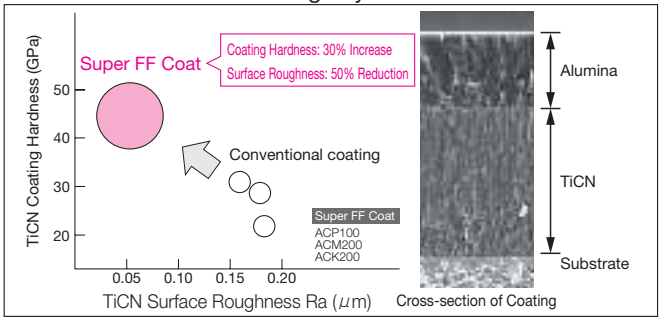


- Compared to conventional tools, the coating hardness has been increased by 40% and the oxidation starting temperature has been increased by 200°C
- Enables more than 1.5 times the machining speed and efficiency of conventional tools
- Achieves more than double the tool life of conventional tools

Super FF Coat
(CVD: Chemical Vapor Deposition)

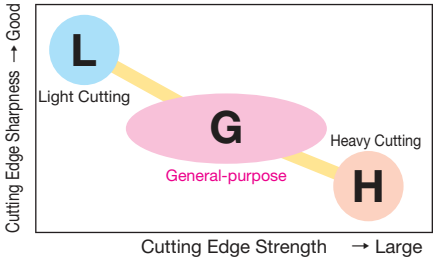
Provides excellent wear resistance and high reliability thanks to our coating stress control technology and the ultra-fine crystal grain coating layer of the Super FF Coat achieved through our proprietary CVD process technology

Characteristics of the Coating Layer



- Achieves excellent chipping resistance with smooth coating and our coating stress control technology
- High-speed, high-efficiency machining at a level more than 1.5 times higher than conventional tools is possible with a high hardness coating layer
- Achieves more than double the tool life of conventional tools

■ Chipbreaker Selection



■ Chipbreaker Lineup

Part Material	P M K S		
Chipbreaker	L Type	G Type	H Type
			
Features	Low Cutting Force	General-purpose Type	High Strength Type
LNEX08 Type Cross Section	 30°	 15°	Not Available
LNEX13 Type Cross Section	 25°	 21°	 21°
Applications	Light Cutting, Low Rigidity Milling and Reduction of Burrs	General-purpose to Interrupted Milling	Heavy Cutting, Heavy Cross-Section Machining and Hardened Steel Milling

■ Application Examples

Inserts are sold separately. Check the pilot diameter (DCB) when selecting the cutter.

For securing the ø80mm and ø100mm cutters to the arbors marked with *, use a JIS B1176 hexagonal socket bolt (ø80: M12 x 30 to 35mm, ø100: M16 x 40 to 45mm).

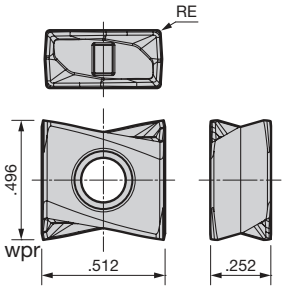
Fig 1



Parts

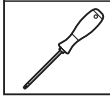
Wrench	Screw	Anti-seize Paste
		

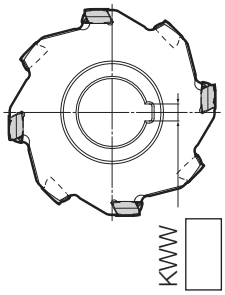


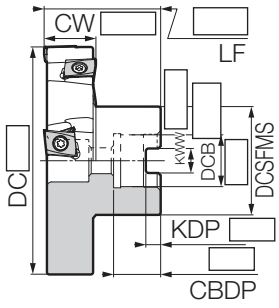
Corner Radius Availability for Custom Tools

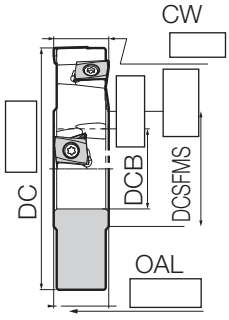
LNEX08 (RE) =0.4 ~ 1.6mm
LNEX13 (RE) =0.4 ~ 3.2mm
*It is possible corner radius after machining will be different than the RE of the insert
*Inserts can be made right or left handed

CW Size	
14mm	LNEX08
18 ~ 22mm	LNEX13

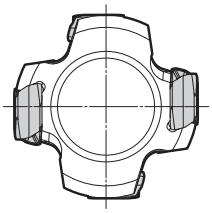
*If CW size is larger than the above dimensions, then product will be designed as a repeater mill

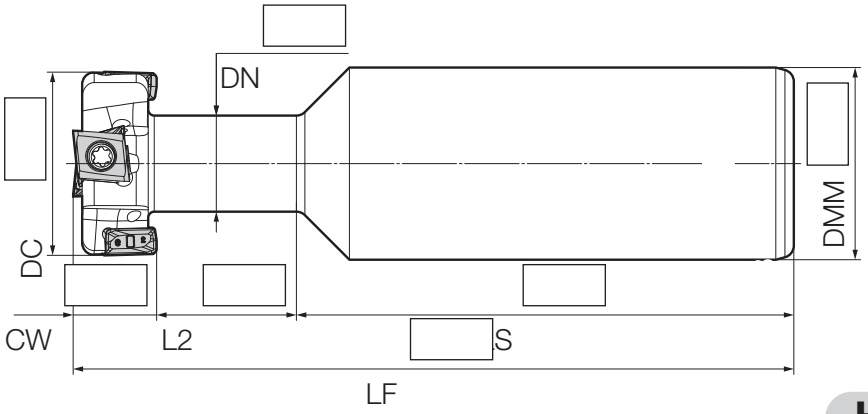






T-Slot Type





Please specify # of effective teeth desired: _____

PWS(F) Type / PWSR Type

■ General Features

A highly reliable shoulder milling cutter with strong, sharp cutting edge and tangential inserts.

PWSR Type, with a 2-stage insert array structure supporting large depths of cut, has been added to the lineup.

■ Features

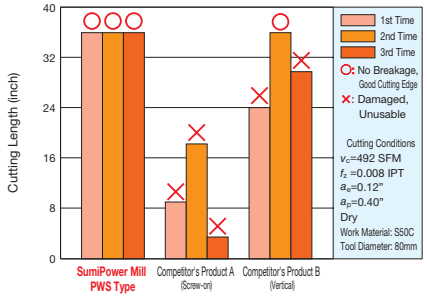
- Tangential inserts with excellent cutting edge strength and optimized breaker provide superb cutting edge and sharpness.
- Serrated insert design created with high-precision formation technology allows stable milling and low chatter even in applications with large tool overhang.
- ACP and ACK series allow a wide range of materials to be covered.

■ Performance

- General-purpose G Type Insert Performance Comparison

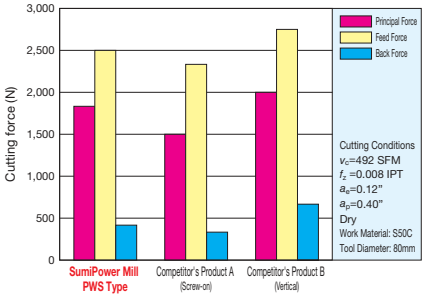
Comparison of Cutting Edge Strength

Strong cutting edge delivers superb stability



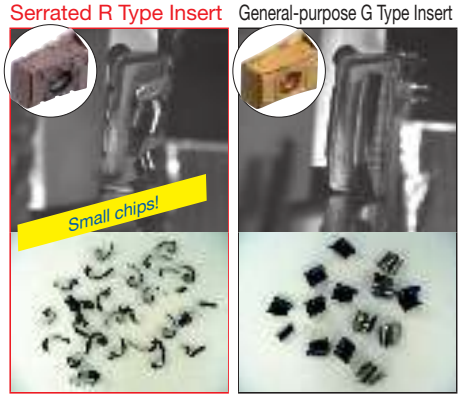
Comparison of Cutting Force

Sharpness approaching that of screw-on inserts



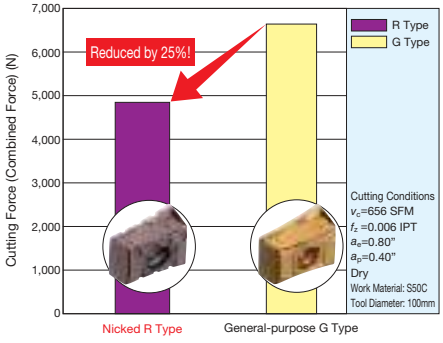
- Serrated R Type Insert Performance Comparison

Serrated R Type Insert | General-purpose G Type Insert

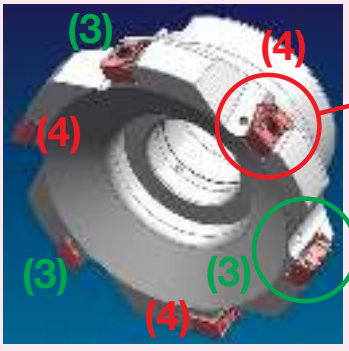


Comparison of Cutting Force

Reduced cutting power and excellent chatter resistance



⚠ Serrated R Type Insert Usage Precautions



1) Precautions when Mounting

When using the serrated R type indexable inserts, mount them so that the serrated grooves alternate as shown in the image on the left.

2) Precautions for Cutting Conditions

As these are mounted as in the image on the left, compared to mounting inserts of the same shape for all blades, the feed rate per tooth is doubled. Accordingly,

f_z = 0..010 IPT

feed rate is set as the upper limit and can be adjusted for use.

Ex.) For use with f_z = 0.2mm/t
With all regular blades: Feed Rate per Tooth 0.008 IPT
With serrated types: Feed Rate per Tooth 0.016 IPT

Using inserts incorrectly may damage tools.

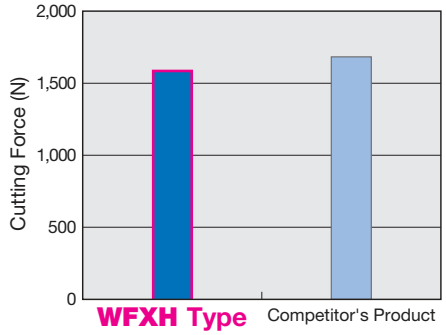
■ General Features

SEC-WaveMill WFXH Types are high performance multi-functional cutters that use a WFX series insert to support roughing at high feed rates and other milling applications.

■ Features

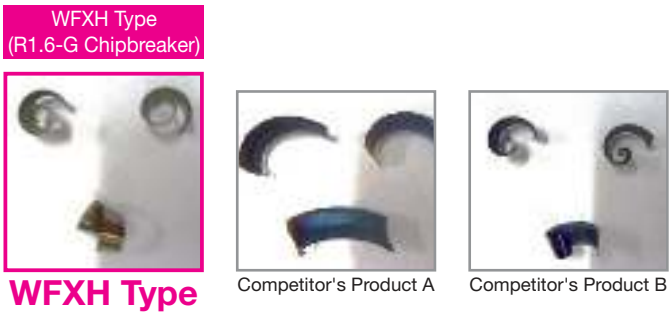
(1) Stable, high-efficiency machining due to insert's superior sharpness
(2) Various milling applications are supported (ramping, helical milling)
(3) Various inserts for the WFX series can be used

Cutting force: High sharpness realises stable cutting



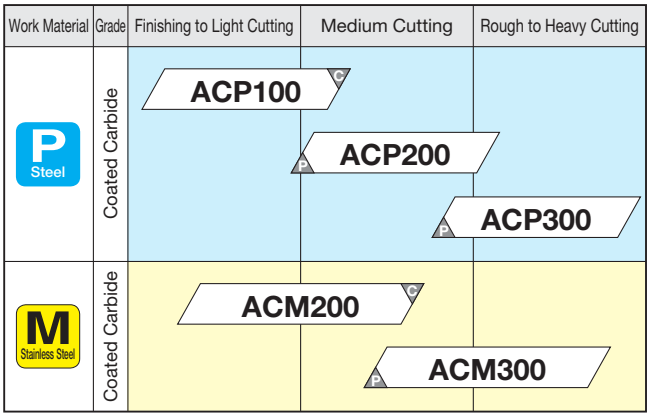
Part Material: 1050
Tool: WFXH12063RS (5 flutes)
Cutting Conditions: v_c=200m/min, f_z=1.0mm/t, a_p=0.5mm, a_e=44mm, Dry

Chips: Small, curly chips at low cutting temperature

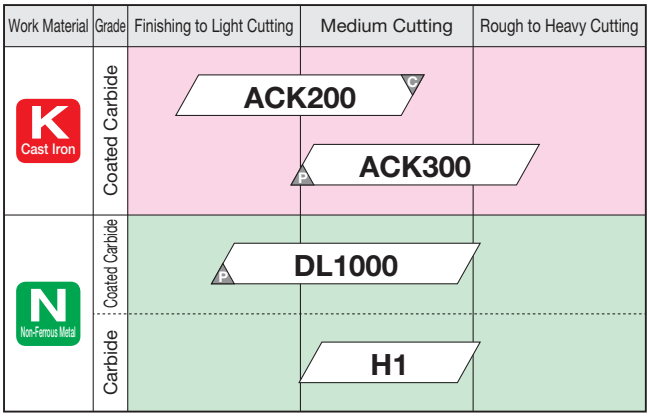


Part Material: 1050
Tool: WFXH12063RS, SOMT120416PDER-G (ACP200)
Cutting Conditions: v_c=200m/min, f_z=1.0mm/t, a_p=1mm, a_e=35mm, Dry

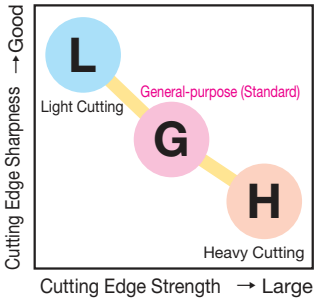
■ Grade Application Range



The letters "C" and "P" at the end of each grade indicate the coating type. ▽: CVD, △: PVD, Blank: Uncoated



■ Chipbreaker Selection



Work Material	P M K			N
Chipbreaker	L Type	G Type	H Type	S Type
				
Features	Low Cutting Force	General-purpose Type	High Strength Type	Sharp Edge
Cutting Edge Cross Section	 20°	 15°	 10°	 25°
Applications	Light Cutting, Low Rigidity Milling and Reduction of Burrs	Main Chipbreaker General Purpose to Interrupted Milling	Roughing, Heavy Interrupted Cutting and Hardened Steel Milling	For Non-Ferrous Metals

■ Precautions for Use (1) Precautions for Corner Finishing

* Corners have remaining material or over-cut portion with respect to the expected corner profile.

· The above recommended cutting conditions may require adjustment depending on machine rigidity and work rigidity.
The above figures are guidelines for use with BT50 machine tools.

· The above recommended cutting conditions assume a tool overhang length of L/D=3 (i.e. overhang length of 3 times tool diameter) or less.
When tool overhang is more than L/D=3 and less than or equal to L/D=5, settings should be adjusted to approximately 70 to 80% of those indicated in the above recommended cutting conditions (a_p, f_z).
When tool overhang is more than L/D=5 and less than or equal to L/D=8, settings should be adjusted to approximately 50 to 60% of those indicated in the above recommended cutting conditions (a_p, f_z).

N·m Recommended Tightening Torque (N·m)

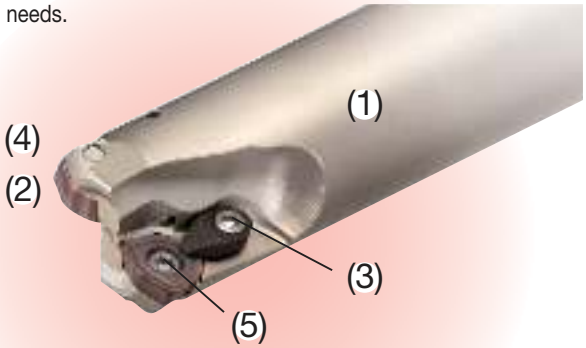
■ General Features

The Metal Slash Mill MSX Type is a multi-purpose cutter capable of roughing at ultra-high feeds. Its wide application range dramatically boosts efficiency. Inserts are available in four sizes, ranging from ø.750" to ø6.000" diameter, to cover a wide variety of milling needs.



■ Features

(1) **Highly Durable Body** Special surface treatment improves scratch resistance

(2) **Versatile Machining Operations** Use for ramping, helical and pocketing

(3) **Double Clamp** Stable milling with a strong clamp is possible (MSX06000 type or MSX08000 type units with ø22mm or less use a single clamp)

(4) **With Coolant Hole** Improved chip evacuation with air or coolant supply hole and specially shaped pocket design

(5) **Insert Shape** Unique tool shape combines sharpness and cutting edge strength

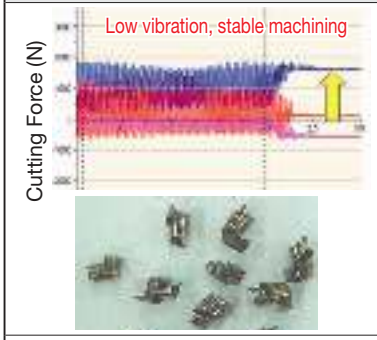
■ Insert Applications and Types

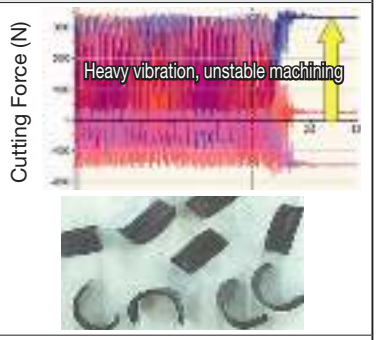
· Insert utilizes a special cutting edge profile.
· Economical, three-cornered insert

Type	General-purpose Type	Strong Edge Type
Applications	General Milling (First Recommendation)	Interrupted Milling
Appearance / Features	 Sharper Edge	 Emphasis on Fracture Resistance

■ Cutting Performance

● Comparison of Cutting Force

MSX Type	Conventional Tool
	




Part Material: 1050
Cutting Conditions: v_c=492 SFM, f_z=0.04 IPT, a_p=0.984in, a_e=0.08in

● Shoulder Milling Comparison of MSX Type and Conventional Tool

MSX Type	Conventional Tool
Performs under high conditions  Cutting force is consistent even when depth of cut is increased, for stable cutting performance.	Prone to chatter  Greater depth of cut increases contact length, which increases cutting force.

■ Product Range

	Type	External Diameter				Applicable Insert
		Inch	Number of Teeth	MM	Number of Teeth

· The above recommended cutting conditions may require adjustment depending on machine rigidity and work rigidity. The above figures are guidelines for use with BT50 machine tools.

· The above recommended cutting conditions assume a tool overhang length of L/D=3 (i.e. overhang length of 3 times tool diameter) or less.
When tool overhang is more than L/D=3 and less than or equal to L/D=5, settings should be adjusted to approximately 70 to 80% of those indicated in the above recommended cutting conditions (a_p, f_z).
When tool overhang is more than L/D=5 and less than or equal to L/D=8, settings should be adjusted to approximately 50 to 60% of those indicated in the above recommended cutting conditions (a_p, f_z).

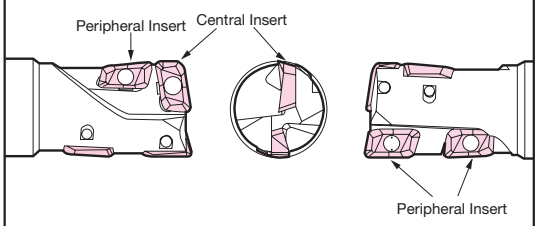
■ General Features

The WaveMill WMM Type performs a variety of operations such as groove milling, shoulder milling, ramping, pocketing, drilling, helical milling, etc., all with a single tool.
With low cutting force and excellent chip evacuation, it is also effective for consolidating tools.

■ Features and Applications

- The WMM Type alone can perform a number of operations such as shoulder milling, slot milling and drilling
- Excellent for high-efficiency ramping, helical drilling and pocketing
- Uses WaveMill inserts for sharpness and cutting edge strength
- The reduction in cutting force enables the same chip evacuation as conventional tools but with less force required
- Easy tool management as only 1 type of insert is used
- Also ideal for stainless steel machining

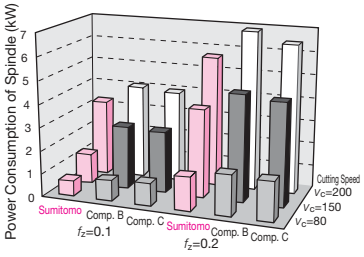
● WMM Type insert arrangement



■ Product Range and Performance

Type	Description	Cutter Dia. (mm) ø20 – ø30 – ø40
2000E	Standard Type	20 – 30
2000EL	Long Type	20 – 30
2000ELH	Long Type w / Coolant Hole	20 – 30
2000EXLH	Extra-Long Type w / Coolant Hole	22 – 30
3000E	Standard Type	32 – 40
3000EL	Long Type	32 – 40
3000ELH	Long Type w / Coolant Hole	32 – 40
3000EXLH	Extra-Long Type w / Coolant Hole	35 – 40

● Performance Comparison (Groove Milling)



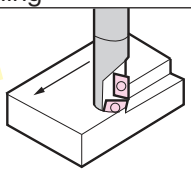
Diameter of Tool: ø25
Work Material: S50C
Cutting Conditions: v_C=80,150,200m/min, f_z=0.1, 0.2mm/t
a_p=15mm, Tool Overhang=40mm

■ Various Milling Examples
Tool: WMM2025E

● Shoulder Milling

304 Stainless Steel

Also cuts stainless steel

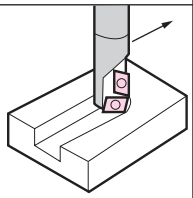


Diameter of Tool: ø25
Insert: APMT103504PDER (ACZ350)
Depth of Cut: a_p=1.00", a_e=0.20"
Cutting Speed: v_C=394 SFM, Feed Rate: f_Z=0.006 IPT
Air Blast

● Slot Milling

Gray Cast Iron

Deep slot milling can be performed easily, Easy chip removal

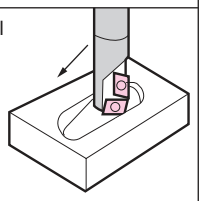


Diameter of Tool: ø25
Insert: APMT103504PDER (ACZ310)
Depth of Cut: a_p=0.60" , a_e=1.00"
Cutting Speed: v_C=590 SFM, Feed Rate: f_Z=0.005 IPT
Air Blast

● Ramping

1050 Block Material

Capable of tapered recess cutting without prepared holes

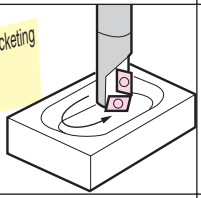


Diameter of Tool: ø25
Insert: APMT103504PDER (ACZ350)
Cutting Width: a_e=1.00", Depth: a_p=0.60"
Cutting Speed: v_C=656 SFM, Feed Rate: f_Z=0.004 IPT
Ramp Angle: θ=15°
Air Blast

● Pocketing

1050 Block Material

Capable of traverse cutting and pocketing with continuous lateral feed from the initial drilling or ramping process

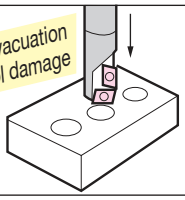


Diameter of Tool: ø25
Insert: APMT103504PDER (ACZ350)
Machining done continuously from a deep drilling process with a depth of 0.60"
Cutting Width: a_e=1.00", Depth: a_p=0.60"
Cutting Speed: v_C=656 SFM, Feed Rate: f_Z=0.004 IPT
Air Blast

● Drilling

1050 Block Material

Capable of easy chip evacuation and drilling without tool damage

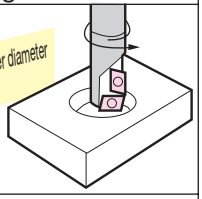


Diameter of Tool: ø25
Insert: APMT103504PDER (ACZ350)
Bore Diameter: ø1.00", Depth: a_p=0.60"
Cutting Speed: v_C=656 SFM, Feed Rate: f=0.004 IPR
Step Feed: 0.20"
Air Blast

● Helical Milling

1050 Block Material

Capable of large boring with diameters 1.2-1.8 times the cutter diameter without prepared holes



Diameter of Tool: ø25
Insert: APMT103504PDER (ACZ350)
Bore Diameter: ø1.6", Depth: a_p=0.80"
Cutting Speed: v_C=984 SFM, Feed Rate: f=0.004 IPR
Axial Feed: 0.60in/Pitch
Air Blast

N·m Recommended Tightening Torque (N·m)

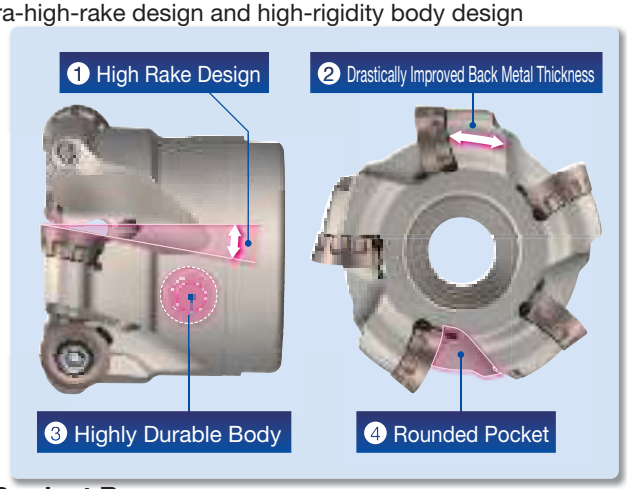
MEMO

■ General Features

SEC-Wave Radius Mill RSX type is a radius cutter that enables stable machining even when using machines with low clamp rigidity, thanks to a body design that achieves excellent sharpness and rigidity.
Lineup of ACM Series grades for stainless steel/exotic alloy, ACP200 grade for steel and ACK300 grade for cast iron to suit a wide range of work materials.
RSX08000 and RSX20000 lineup extended to support a wide range of machining.

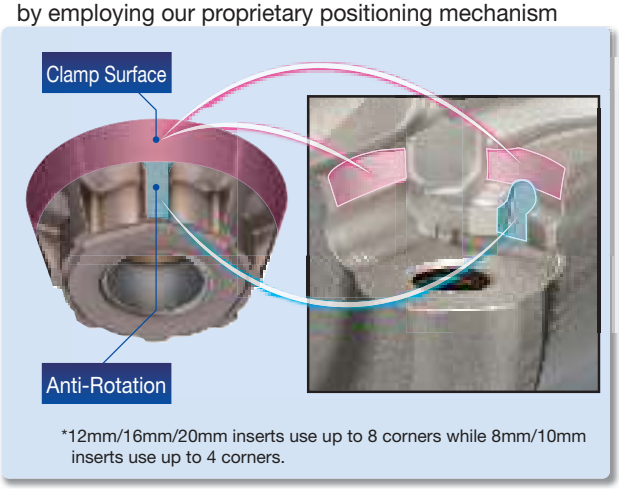
■ Low-resistance, Low-vibration Design

Achieves low-resistance, low-vibration machining thanks to ultra-high-rake design and high-rigidity body design



■ Excellent Operability

Enables easy corner control with high accuracy and operability by employing our proprietary positioning mechanism



*12mm/16mm/20mm inserts use up to 8 corners while 8mm/10mm inserts use up to 4 corners.

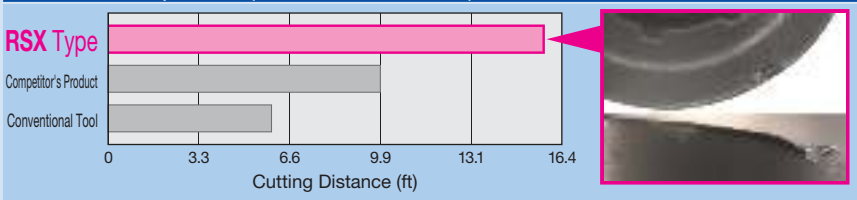
●: Inch in stock, Blank: Not available

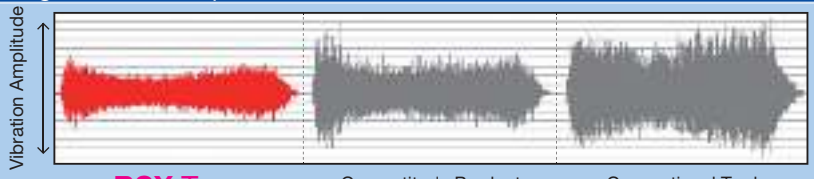
■ Cutting Performance

Tool Life Comparison (Fracture Resistance)



Achieves a tool life approximately 1.6 times longer than that of our competitors' products

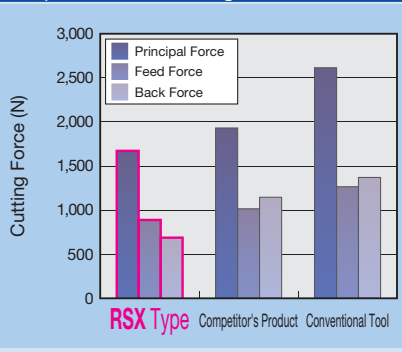
Cutting Vibration Comparison



RSX Type Competitor's Product Conventional Tool

Reduced by approximately 15% compared to competitors' products

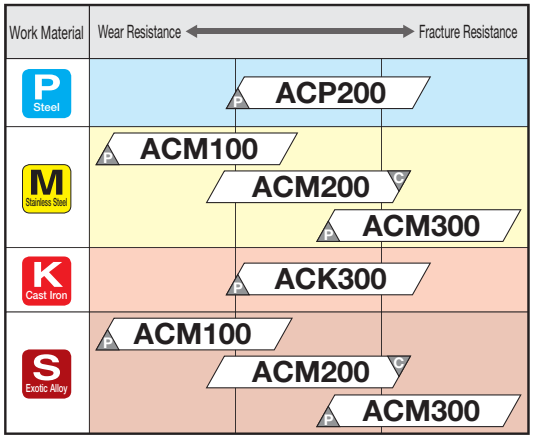
Comparison of Cutting Force



Part Material: 304 Stainless Tool: ø50
Cutting Conditions: *Vc* = 656 SFM, *fz* = 0.0197"
ap = 0.08", *ae* = 0.40", Wet

■ Long, Stable Tool Life

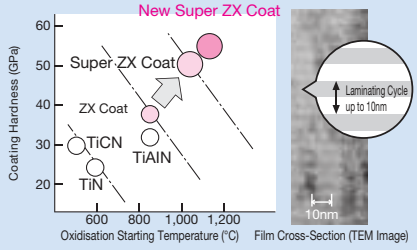
Adopts ACP200 grade for steel and ACK300 grade for cast iron machining, enabling milling of steel, stainless steel, cast iron and exotic alloys



The letters "C" and "P" at the end of each grade indicate the coating type.
▽: CVD, △: PVD, Blank: Uncoated

ACP200/ACM100/ACM300/ACK300

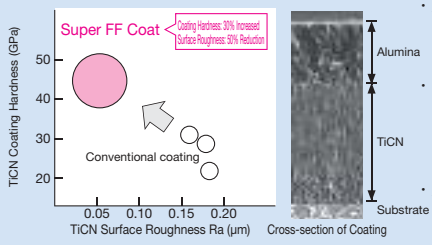
NEW SUPER ZX COAT



- Compared to conventional tools, the coating hardness has been increased by 40% and the oxidization starting temperature has been increased by 200°C
- Enables more than 1.5 times the machining speed and efficiency of conventional tools
- Achieves more than double the tool life of conventional tools under the same cutting conditions

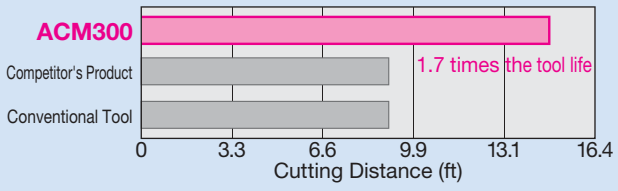
ACM200

SUPER FF COAT



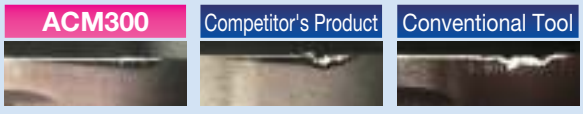
- Achieves excellent chipping resistance with smooth coating and our coating stress control technology
- High-speed, high-efficiency machining at a level more than 1.5 times higher than conventional tools is possible with a high hardness coating layer
- Achieves more than double the tool life of conventional tools under the same cutting conditions

Tool Life (304 Stainless Machining)

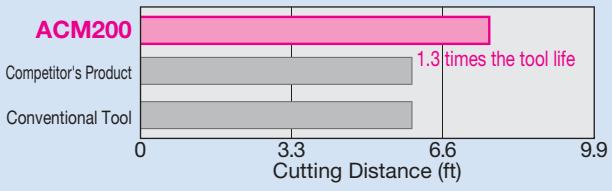


Cutter: RSXF12050RS
Insert: RDET1204M0EN-G
Cutting Conditions: *vc* = 656 SFM, *fz* = 0.02" IPT
ap = 0.08", *ae* = 0.40" Wet

(Cutting Distance: 8.86ft)

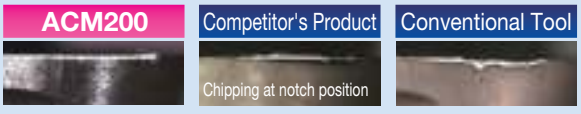


Tool Life (17-4 PH Machining)



Cutter: RSXF12050RS
Insert: RDET1204M0EN-G
Cutting Conditions: *vc* = 492 SFM, *fz* = 0.012 IPT
ap = 0.08", *ae* = 0.40" Wet

(Cutting Distance: 5.91ft)

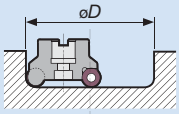


■ Machining Applications

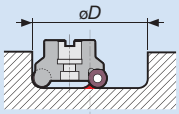
Can be used for various types of high-efficiency machining such as deep shoulder milling of molds, ramping, and helical milling.

Precautions for Helical Milling

Standard Diameter

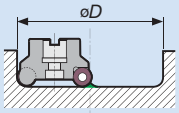


Standard Diameter or Below



Center uncut portion cannot be removed with the same cutter.

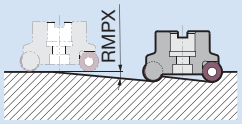
Standard Diameter or Above



Center uncut portion can be removed by traverse cutting with the same cutter.

Precautions for Ramping

Use at the RMPX below or lower.



Recommended Values for Helical Milling and Ramping

NOTE: The cutting conditions above are a guide.
Actual Conditions will need to be adjusted according to machine rigidity, work clamp rigidity, cutting depth and other factors.

■ General Features

The WRCX Type SEC-Wave Radius Mill is a versatile, high-efficiency cutter that is suited to various types of machining such as deep shoulder milling of molds, ramping, and helical milling.
Furthermore, a wide selection of chipbreakers and grades covers a wide range of work materials, from steel to non-ferrous metals.

■ Features

- Durable body with special surface treatment offers significantly improved tool life and reliability.
- Superb chatter resistance with anti-vibration edge design.
- All sizes come with coolant holes preventing chip build-up and jamming.
- Sturdy screw clamp with Torx Plus screw insert mounting ensures stable machining.

■ Product Range

	Metric Type	O.D. (mm)	# of Teeth
Shell Type ☞H161, 164	WRCX(F)12000R(S)	ø40 to ø80	4-6
	WRCX(F)16000R(S)	ø63 to ø100	3-6
	WRCX20000R(S)	ø125 to ø160	5-6
Endmill Type ☞H165	WRCX08000E	ø20 to ø25	2-3
	WRCX10000E	ø25 to ø32	2-3
	WRCX16000E	ø40 to ø50	2-3
Modular Type ☞H214	WRCX08000M	ø20 to ø25	2-3
	WRCX10000M	ø25 to ø32	2-3

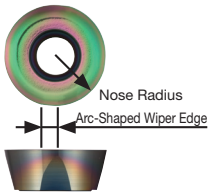
Inch Type	O.D. (Inch)	# of Teeth
WRCX30000R	ø2.000"	4
WRCX40000R	ø2.0 to ø4.0"	4-6
WRCX60000R	ø3.0 to ø6.0"	5-8
WRCX80000R	ø4.0 to ø6.0"	6-8
WRCX30000EW	ø1.0 to ø1.5"	2-4
WRCX30000ELC	ø1.0 to ø1.5"	2-4
WRCX40000EW	ø1.25 to ø1.5"	2-3
WRCX40000ELC	ø1.25 to ø1.5"	2-3

■ Abundant Insert Series

- In addition to conventional WRC Type inserts, the new lineup includes non-ferrous metal inserts and surfing inserts

Non-Ferrous Metal Inserts QPET ○○○○○○ PPFR-S

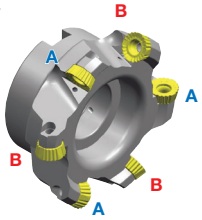
- Good surface roughness with arc-shaped wiper edge
- Sharp corners
- Four-cornered insert



Surfing Insert QPMT ○○○○○○ PPER-R

- Cutting edges feature unique rippled design
- Four-cornered insert
- Low cutting force, enabling use on low-rigidity machines as well

*Use in combinations that alternate cutting edge **A** and cutting edge **B**.
(Only useable on cutters with an even number of cutting edges)



Shift the phase in 90° increments to mount inserts

● Maximum Allowable Spindle Speed when Milling Non-Ferrous Metal (Unit: RPM)

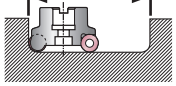
Cutter Dia. DC(mm)	Insert Cat. No. QPET10·····-S	QPET12·····-S	QPET16·····-S
25	28,000		
32	25,000		
40		22,000	15,000
50		20,000	14,000
63		18,000	13,000
80		16,000	12,000
100			10,000

Even if the speed used is within the maximum allowable revolution speeds listed above, abnormal vibrations may occur due to machine rigidity or other factors. Therefore, it is advisable to start operation at half the maximum allowable revolution speed and increase the speed gradually while checking for abnormalities.

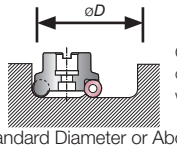
■ Usage Precautions

● Precautions for Helical Milling

Standard Diameter

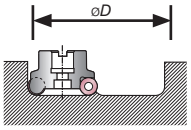


Standard Diameter or Below



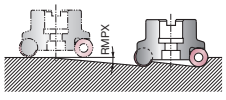
Center uncut portion cannot be removed with the same cutter.

Standard Diameter or Above



Center uncut portion can be removed by traverse cutting with the same cutter.

● Precautions for Ramping
● Use at the RMPX below or lower.



● Recommended Values for Helical Milling and Ramping

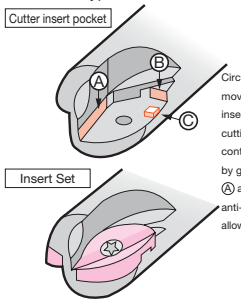
MEMO

3D Profile Roughing

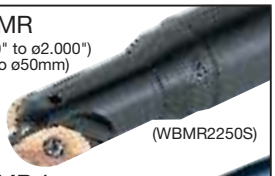
■ General Features

A lineup of ø.750" to ø2.000" ballnose endmill models for 3D profile roughing of die molds and machine parts.

● WBMR Type Anti-Rotation Mechanism



WBMR
(ø.750" to ø2.000")
(ø20 to ø50mm)



(WBMR2250S)

WBMR-L
(ø1.000" to ø1.250")
(ø20 to ø50mm)

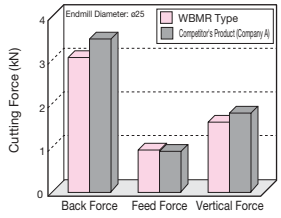
(WBMR2500SL)

■ WBMR2000 / 2000L (ø.750" to ø2.000")

- Wave-shaped high rake angle insert design achieves a sharp cutting edge and low resistance
- Economical M-class insert with strong cutting edge
- Anti-rotation guides prevent insert from slipping during machining
- Integrated insert shape is used for large diameter cutters, enabling easier tool management

■ Performance

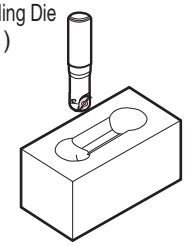
● Cutting Force



Part Material: 1050 Steel
Cutting Conditions
(Shoulder Milling, Down Cut)
vc = 656 SFM
f_Z = 0.006 IPT
Axial Depth of Cut 0.197"
Radial Depth of Cut 0.197"

■ Application Examples

● Cold Molding Die (SKD11)



Evaluation
Flank wear width after continuous cutting for seven hours was less than competitor's product. Stable cutting was observed.

WBMR2200S (ø20)
Insert Grade: ACZ350
Cutting Conditions
n = 2,200min^{-1}
v_f = 500mm/min
Depth of Cut: 0.3 to 2mm
Insoluble Cutting Oil

Parts H167 Recommended Cutting Conditions H167

■ General Features

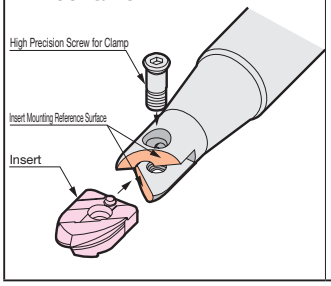
A lineup of ø0.5" to ø1.25" ballnose endmill models for 3D profile finishing of die molds and machine parts.

3D Profile Finishing

■ WBMF10000 Type (ø0.5" to ø1.25")

- Simple but precise clamping design
- Original large helix angle design
- Sharp cutting edge that produces good surface roughness
- Excellent wear resistance with Super ZX Coat

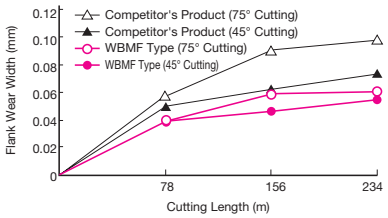
● WBMF Type clamp mechanism.



WBMF1000

■ Performance

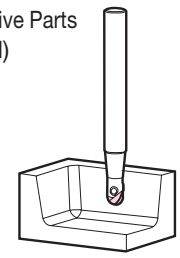
● Insert Life



Results
WBMF Type outperforms competitors' products in most processes including plan profiling, with better wear resistance.
Part Material: 1050
Machining Method: Ramping (45°, 75°)
Cutting Conditions
n = 2,000 RPM
v_f = 78.74 IPM
a_p = 0.012"
ρ_f = 0.024"
Dry

■ Application Examples

● Mold for Automotive Parts (Injection Mold)



Evaluation
Much better finishing as compared to competitors' products, with polishing time required reduced by half.
WBMF1000 Type
Work Material: 1055
Process: Contouring
Cutting Conditions
n = 2,500 RPM
v_f = 31.5 IPM
a_p = 0..028"
Overhang = 5.9"
Wet

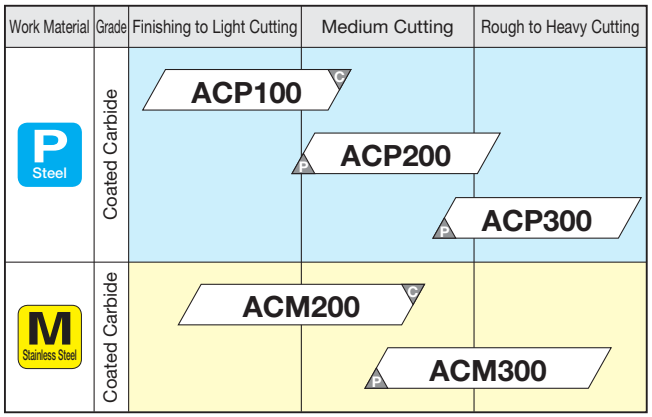
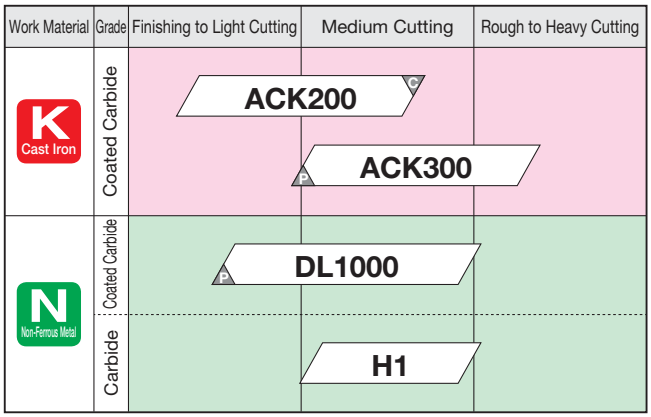
■ General Features

The SEC-WaveMill WFXC Type is a chamfering tool that uses a WFX series insert. A wide variety of grades support various work materials.

■ Grade Application Range





The letters "C" and "P" at the end of each grade indicate the coating type. C: CVD, P: PVD, Blank: Uncoated

■ Precautions for Use

Chamfering tools use a straight cutting edge that enables the chamfering range to be changed depending on the nose radius (RE) of the insert mounted to the body.
Work diameter: Use within the range shown in the table below, no lower than DC1 and no higher than DC2.
Depth of cut: cutting to a depth shown by the distance from the tool tip (a) in a straight line to the cutting edge. (b) is possible.

■ Features

New

- **Drastically Reduced Runout Adjustment Time**
  Simple screw-fastening structure enables fine adjustments to be made easily
- **Through-Tool Coolant**
  Secures a supply of coolant to the cutting edge and breaks chips thoroughly
- **Lightweight Aluminum Alloy Body**
  Utilizing aluminum alloy to achieve a total weight of less than 2.87lbs for a ø125mm cutter with 22 teeth.

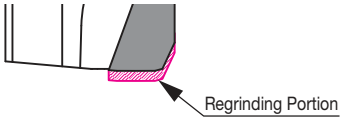
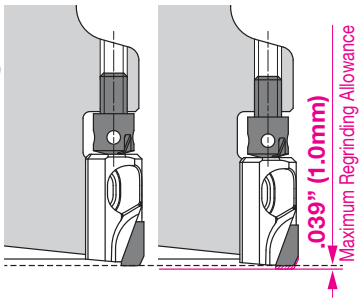
Sumitomo Services Offering in USA!

- **Pre-setting**
- **Insert Reconditioning**

Benefits of Reconditioning

- Reduces running costs by drastically increased insert regrinding allowance (to .039" / 1.0mm)
- Assuming .008" (0.2mm) of regrinding each time, an edge can be reground up to 5 times. (*Peripheral edge cannot be reground.)





For service inquiries, please contact local Sumitomo Sales Representative or Engineering Department

MEMO

HF Type

■ General Features

The HF Type high-efficiency aluminum alloy cutter employs a unique blade design to achieve machining without burrs.
New HFFH Type with coolant holes is now available as a BBT30 (BIG-PLUS™) arbour integrated version.

Work Material

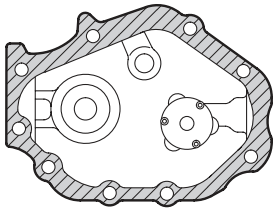
· Aluminum and aluminum alloys
· Other non-ferrous metals

(Not suited for cast iron or steel.)

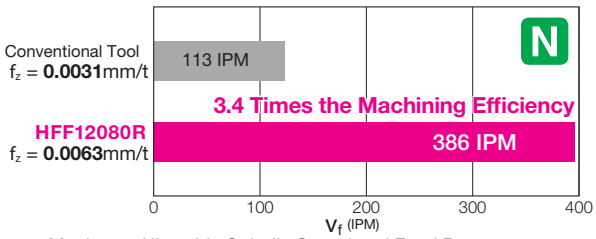
■ Features

● Achieves high-efficiency milling with V_f of over 787 IPM thanks to its multi-blade design (3 edges per inch)

High-feed, High-efficiency Milling by Multi-edge Design

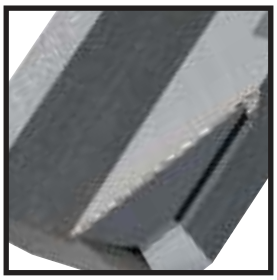


Workpiece: Aluminum Case (Frame Milling)
Tool: **HFF12080R-25.4** (ø80 10-flute),
Conventional Tool (ø80 6-flute)



■ Maximum Allowable Spindle Speed and Feed Rate

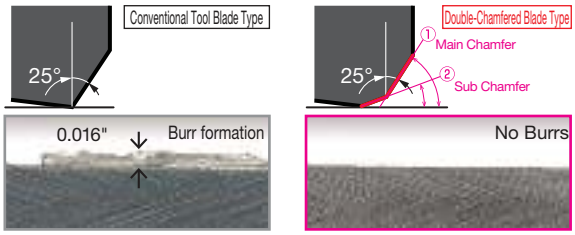
Cutter Dia. (mm)	nmax (RPM)	V_c (SFM)	f_z (IPT)	Maximum Number of Teeth	V_f (IPM)
ø80	11,000	9,065	up to 0.008"	10	up to 866"
ø100	9,500	9,787	up to 0.008"	12	up to 897"
ø125	7,500	9,659	up to 0.008"	15	up to 886"



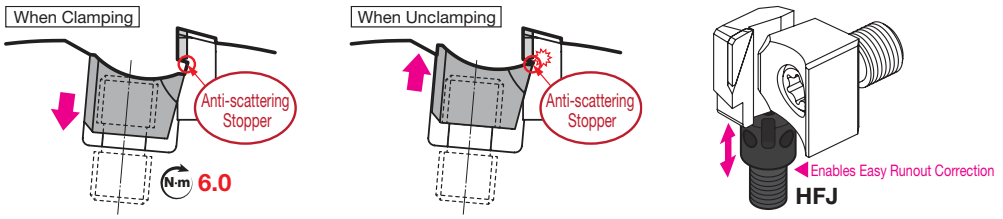
● Reduces burrs by using a double-chamfered blade type

Drastically reduces burrs by preventing the plastic deformation that causes burrs.

Work Material: **A6061** Sheet Metal
Cutting Conditions: V_c = **10,308 SFM**, f_z = **0.004 IPT**, a_p = **0.02"**, Dry



● Wedge clamp with anti-scattering mechanism ensures safety and operability

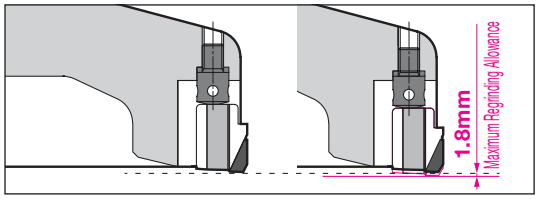


Ensure that the maximum allowable spindle speed (n max) specified for each cutter diameter is not exceeded. (See the table at upper right)

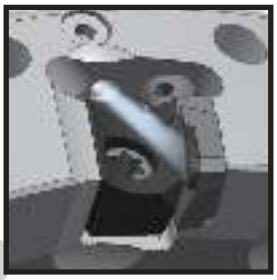
● Reduces running costs by drastically increasing blade regrinding allowance (to 0.071")

Assuming 0.008" of regrinding each time, an edge can be used up to 10 times.

(Given conditions of normal wear with a_p = **0.06"** or less)



The regrinding amount has been drastically increased compared to conventional screw-lock types



● Internal coolant improves chip evacuation performance (HFFH Type, HFFH-BBT30 Type)

The internal coolant effectively prevents chips from becoming clogged or biting into the work material and achieves longer tool life. (Use an internal coolant compatible arbor)

N·m Recommended Tightening Torque (N·m)

*1 BIG-PLUS™ is a registered trademark of BIG DAISHOWA Co., Ltd.
*2 Can also be used with BT30 spindle machines.

■ Chipbreaker Selection

Work Material	N				
Type	L Type	G Type	GX Type	H Type	W Type
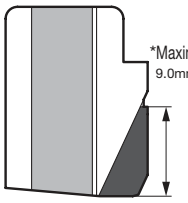
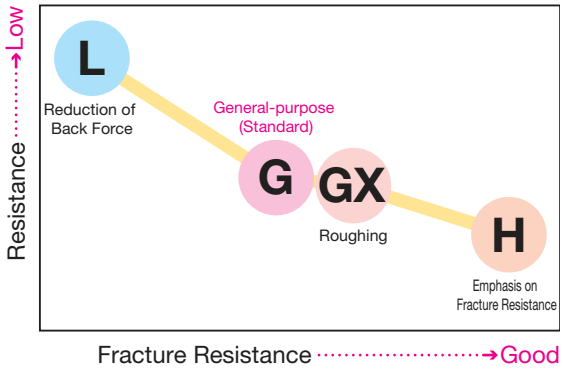
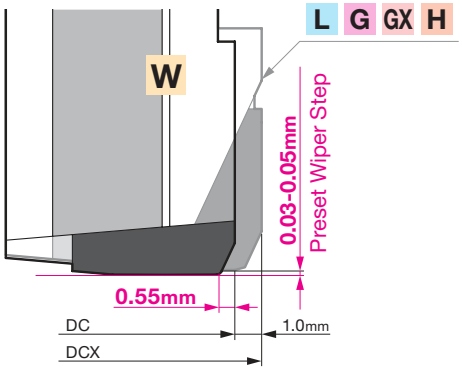
Cutting Edge Shape					Features	Low Resistance	Standard	Long Edge	High Strength	Wiper
Applications	Reduction of Back Force	General-purpose	Roughing	Emphasis on Fracture Resistance	
Edge Length (*)	0.236”	0.236”	0.354”	0.236”	



■ Chipbreaker Selection Guide

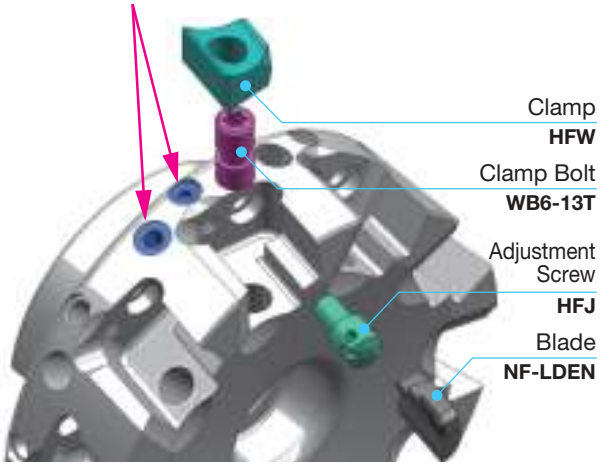


■ Wiper Blade Step Amount



■ Structure of HF Type

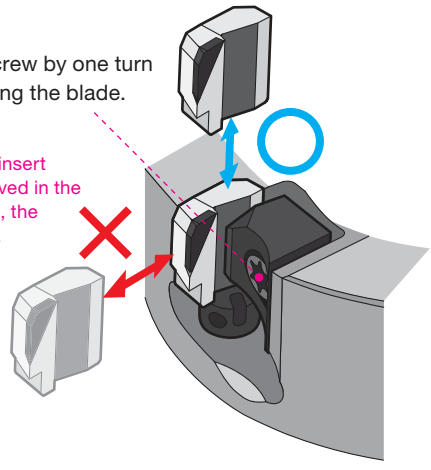
The axial set screw and balance adjustment screw hole have an embedded special part that prevents the insertion of screwdrivers or hex wrenches.



■ Blade Mounting Direction

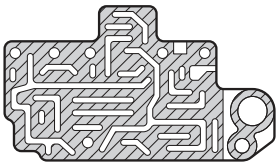
Loosen the screw by one turn before removing the blade.

⚠ Note that if the insert is forcibly removed in the wrong direction, the part may break.



■ Application Examples

● Workpiece: Automotive Component		Sumitomo
Work Material: Aluminum Alloy	Body	HFFH12100R-25.4
	Blade Cat. No.	NF-LDEN12T3ZDTR-H
	Grade	DA1000
	Number of Teeth	12
	v_c(SFM)	6,181
	n(RPM)	6,000
	v_f(IPM)	236”
	f_z(IPT)	0.002”
	a_p(inch)	0.008”
	Coolant	Wet (Internal Coolant Supply)
	Results	Achieves 3,600 units, double the tool life of conventional external coolant supply types. Good machined surface



● Workpiece: Engine Component		Sumitomo
Work Material: Aluminum Alloy	Body	HFFH12125R-31.75
	Blade Cat. No.	NF-LDEN12T3ZDFR-G
	Grade	DA1000
	Number of Teeth	15
	v_c(SFM)	9,663
	n(RPM)	295
	v_f(IPM)	266”
	f_z(IPT)	0.0024”
	a_p(inch)	0.08”
	Coolant	Wet (Internal Coolant Supply)
	Results	In contrast to conventional external coolant supply types, the tool life has reached 1.7x greater at 17,000 units and creates finer chips

N·m Recommended Tightening Torque (N·m)

RF Type

■ General Features

The RF Type cutter for aluminum alloy has a lightweight body designed for high-speed, high-performance roughing to finish milling of aluminum alloy and other non-ferrous metals.

■ Work Material

- Aluminum and aluminum alloys
- Other Non-Ferrous Metals

(Not suited for cast iron or steel.)

■ Features

- From Roughing to Finishing Processes: Roughing: Economical carbide insert / Finishing: High-precision SUMIDIA insert
- Strong and Lightweight Body: Special aluminum alloy body. 40% lighter than steel cutters. Hard anodizing. Improved efficiency with higher spindle speeds, lower spindle loads and shorter tool change time
- Safety Design: Prevents inserts from dislodging from cutter due to centrifugal force. (Speeds must be within max. recommended conditions) To prevent warping, wedges are not used in the cutter construction
- Easy Runout Adjustment: External setting gauge is used for easy tool presetting. High-precision cutter construction - units fitted are within 10μm runout even before setting

■ Application Examples

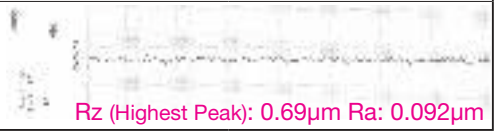
Workpiece (Work Material)	Tool Cutting Blade (Insert Grade)	Cutting Conditions v_c = Cutting Speed (SFM) v_f = Feed Rate (IPM) a_p = Depth of Cut (inch)	Results
Case (ADC12)	RF4160R SUMIDIA Blade (DA2200)	v_c = 9,843 v_f = 225 a_p = 0.004"	Finished Surface Roughness: Ra=0.2μm, Number of Workpieces: 30,000 pcs (30x tool life of carbide inserts)
Contact Surface of Transmission Case (ADC12)	RF4125R SUMIDIA Insert (DA1000)	v_c = 9,843 v_f = 300 a_p = 0.06"	Finished Surface Roughness: Ra=0.3μm, Number of Workpieces: 20,000 units
Contact Surface of Cylinder Head (AC4C)	RF4250R Carbide Insert (H1)	v_c = 6,562 v_f = 296 a_p = 0.14"	Rough Cutting Number of Workpieces: 10,000 units

● Maximum Allowable Spindle Speed

Cat. No.	n max (RPM)
RF4080R	17,000
RF4100R	15,900
RF4125R	13,500
RF4160R	11,000
RF4200R	9,000
RF4250R	7,600
RF4315R	6,000

■ Finished Surface Roughness

- Process: Finish Milling
- Machine: Vertical Machining Centre
- Arbour: HSK63A
- Work Material: Si 10 to 12% Al Alloy
- Cutter: RF4100R 6-Flute (1 Wiper)
- Grade: SUMIDIA (DA1000)
- v_c = 16,372 SFM
- n = 15,900 RPM
- v_f = 450 IPMn
- f_z = 0.0047 IPT
- a_p = 0.0197", Wiper a_p = 0.0012"
- Dry



Rz (Highest Peak): 0.69μm Ra: 0.092μm

■ Recommended Cutting Conditions

Si content of 12.6% or less

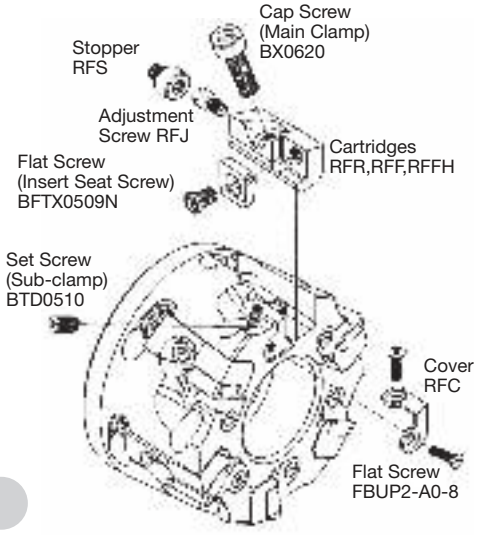
ISO	Work Material	Hardness	Cutting Speed v_c (SFM) Min. - Max.	Feed Rate f_z (IPT) Min. - Max.	Insert Grade
N	Aluminum Alloy	-	6,560 - 16,400	0.002 - 0.008	DA1000 DA2200
		-	3,280 - 8,200	0.002 - 0.008	H1

Si content of over 12.6%

ISO	Work Material	Hardness	Cutting Speed v_c (SFM) Min. - Max.	Feed Rate f_z (IPT) Min. - Max.	Insert Grade
N	Aluminum Alloy	-	1,320 - 2,630	0.002 - 0.008	DA1000 DA2200
		-	660 - 1,320	0.002 - 0.008	H1

Note The cutting conditions above are a guide. Actual conditions will need to be adjusted according to machine rigidity, work clamp rigidity, depth of cut and other factors.

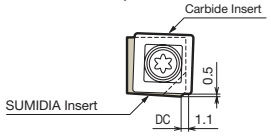
■ Structure of RF Type



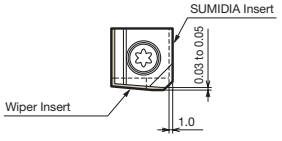
● Recommended Cutting Edge Position

We recommend positioning as in the figure below when mounting carbide inserts or SUMIDIA inserts (blades).

● When roughing and finishing in the same process



● When using wiper edge



⚠ CAUTIONS (For more details, refer to the instruction manual included with the product)

As it is possible to mix different types of inserts/blades, it is important to take note of the following.

- Do not mix reground and new inserts or inserts with a different regrinding amount on the same cutter.
- Carbide and SUMIDIA inserts must be arranged alternately.
- Ensure proper balance by fixing the SUMIDIA inserts of the blades on opposite sides of the cutter.

SRF Type

■ General Features

The SRF Type small diameter aluminum alloy cutter is ideal for aluminum alloy machining on high-performance small machines.

■ Features

- Ideal for small machines
  Especially reliable on BT30 class small machines.
- From roughing to finishing processes
  Utilizes SUMIDIA DA1000 inserts
  with effective cutting edge length of 5mm
- Economical NF-type Inserts:
  NF Type SUMIDIA inserts with tough DA1000 grade lower tooling costs.
- High-speed Cutting with SUMIDIA:
  Maximum spindle speeds of up to n = 20,000 RPM
  (Actual spindle speeds must be set within the rotational limits of your machine and holder)
- Simple Runout Adjustment Mechanism:
  Simple insert direct mounting design
  for runout precision with easy fine adjustment

■ Application Examples

Workpiece (Work Material)	Tool Insert Cat. No. (Insert Grade)	Cutting Conditions n = Spindle Speed (RPM) v_f = Feed Rate (IPM) a_p = Depth of Cut (inch)	Results
Cam Case (ADC12)	SRF50R NF-SNEW09T3ADTR (DA1000)	n = 6,000 v_f = 95 a_p= 0.02"	12,000 pcs machined with no problems
Computer Case (ADC12)	SRF50R NF-SNEW09T3ADTR (DA1000)	n = 15,000 v_f = 295 a_p= 0.008"	2.5 times more efficient endmill operation
Differential Case (ADC12)	SRF63R NF-SNEW09T3ADTR (DA1000)	n = 8,000 v_f = 160 a_p= 0.02"	No obstructions on tool magazine when mounting ø63 cutter on small machines.

■ Recommended Cutting Conditions

Si content of 12.6% or less

ISO	Work Material	Hardness	Cutting Speed v_C (SFM) Min. - Max.	Feed Rate f_Z (IPT) Min. - Max.	Insert Grade
N	Aluminum Alloy	-	6,560 - 13,120	0.002 - 0.008	DA1000

Si content of over 12.6%

N	Aluminum Alloy	-	1,320 - 2,630	0.002 - 0.008	DA1000

Note The cutting conditions above are a guide. Actual conditions will need to be adjusted according to machine rigidity, work clamp rigidity, depth of cut and other factors.

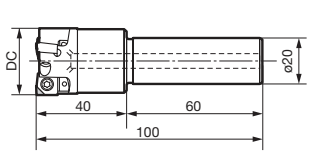
Fig 1

Fig 2



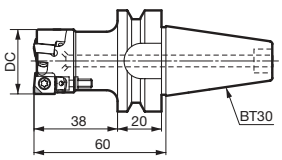


Fig 3

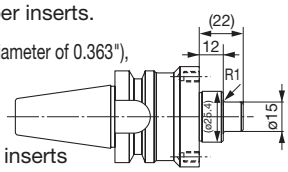
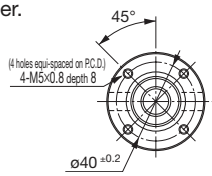
- Standard inserts and wiper inserts can be used on the same cutter body.
- Standard inserts with nose radius should be used where chatter is present. These cannot be used with wiper inserts.
- Inserts can be reground 3 times (up to minimum IC diameter of 0.363"), but the cutting edge height changes by the reground amount.



- Do not mix new and reground inserts or inserts with different regrind amounts on the same cutter.
- When using reground inserts, it is advisable to re-confirm cutting edge position with a tool pre-setter.
- Arbour for SRF30R, SRF40R



When using body SRF30R and SRF40R cutters, the arbor needs to be modified as shown above.
(1. Reduce part of the arbor's adapter shaft length from ø1.00" to ø0.590". Add 4 tap holes for (M5) mounting bolts.)
Use hex socket bolts M5 × 0.787" for securing the body.

Maximum Depth of Cut (SRF50R, 5-Flute)

The table below contains guidelines on the maximum depth of cut, determined from internal tests. 'O' marks indicate the possible application range. Actual cutting conditions should be set based on the actual machine and workpiece characteristics.

Depth of Cut a_p (inch) \ Feed Rate	Feed Rate v_f (IPM)		
	100	160	200
	Feed Rate Per Tooth f_z (IPT)		
	0.002	0.003	0.004
0.02	O	O	O
0.04	O	O	O
0.06	O	O	O
0.08	O	O	O

■ General Features

SEC-WaveMill WAX type is a high speed and high efficiency cutter capable of processes from rough milling to finishing of non-ferrous metals such as aluminum alloy.

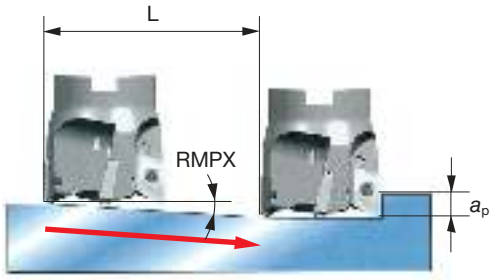
■ Features

- Ramping
- For Helical Milling
- Safety Design:
  · Prevents dislodging of inserts caused
  · by centrifugal force.
- Coolant Compatible:
  · Coolant holes are a standard feature for the WAX series.
- Excellent Adhesion Resistance:
  · Top rake face of the insert has a lapped finish.
  · DLC Coat inserts are available for improved adhesion resistance.

■ Ramping

Maximum ramping angle (RMPX) depends on cutter diameter.
Minimum milling distance (L) for any depth of cut can be calculated by the equation below:

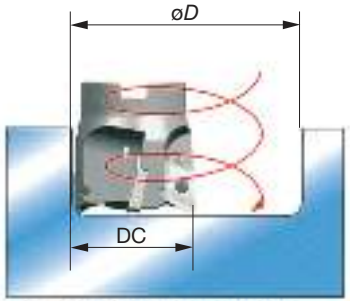
$$L = \frac{a_p}{\tan RMPX} \quad (mm)$$



■ Ramping Angle

Cutter Dia. DC(mm)	Maximum Ramping Angle RMPX	
	WAX3000 Type	WAX4000 Type
20	28°	
25	17°	26°
32	12°	18°30'
40	9°	13°
50	7°	9°30'
63	5°	7°
80	3°	5°
100	3°	4°
125	2°	3°

■ Helical Milling



■ Helical Milling Diameter

Cutter Dia. DC(mm)	WAX3000 Type		WAX4000 Type	
	Min. Dia.	Max. Dia.	Min. Dia.	Max. Dia.
20	0.87	1.30

High-speed, High-efficiency Milling for Cast Iron

- High-Efficiency Milling of Gray Cast Iron
  - · Utilizes solid CBN - SUMIBORON BNS800 for high-speed cutting of v_c = 4,920 SFM.
  - · High speed roughing with depth of cut up to 0.118"
  - · Wiper insert for high-speed finishing
- Low Cost
  - · Economical double-sided insert with 8 usable corners
  - · Insert can be reground and used again
- Simple Runout Adjustment Mechanism
  - · Simple design for insert direct mounting
  - · Easy yet precise runout precision adjustment

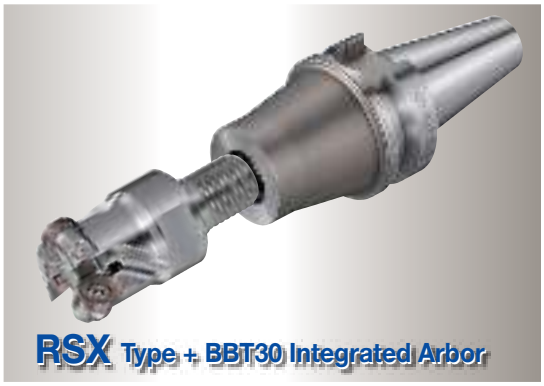
■ General Features

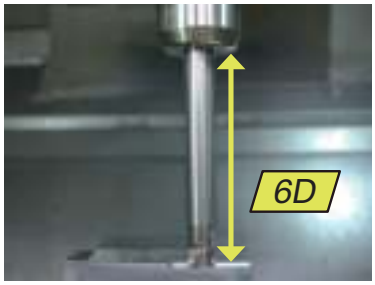
- Indexable head endmills are available in 8 types!
  - · Shoulder Milling Endmill **WFX Type**
  - · High-Efficiency Endmill **WFXH Type**
  - · Corner Radius Endmill **RSX Type**
  - · Chamfering Endmill **WFXC Type**
  - · Endmill for various applications **WEZ Type**
  - · Stop-Boring Endmill **WEX Type**
  - ·Ultra-High-Feed Endmill **MSX Type**
  - · Multi-Function Radius Endmill **WRCX Type**
  - · Tangential Endmill **TSX Type**
- In addition to carbide arbors and steel arbours, the lineup of integrated BBT types enables a variety of combinations

Suitable for milling with ***long overhangs*** *when combined with carbide or steel arbors*

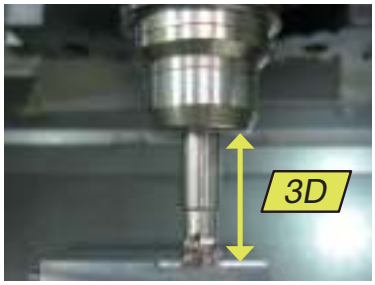
When combined with BBT integrated arbors, ***high load milling*** *is supported*



Modular Type + Carbide Arbor



Standard Type (Integrated Arbor)



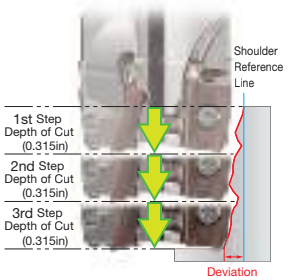
Note: Overhang varies depending on cutting conditions such as the tool used, machine rigidity and work clamp rigidity.

■ Screw Size and Mounting Cutter Size

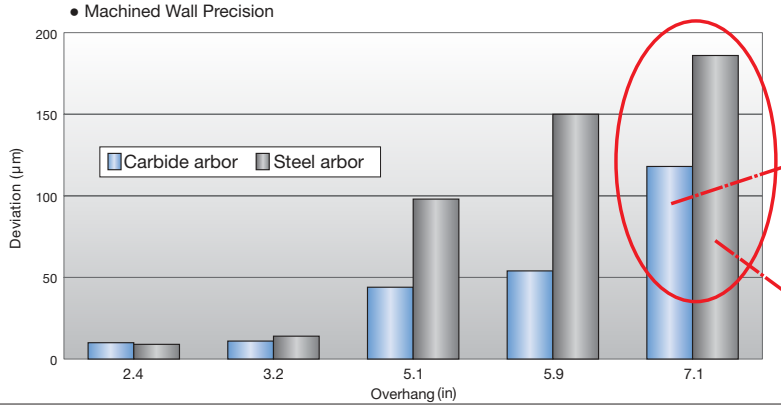
Screw **CRKS**	Applicable Cutter Size (DC)
M8	ø16, ø18
M10	ø20, ø22
M12	ø24, ø28
M16	ø30, ø32, ø35, ø40

■ Cutting Performance

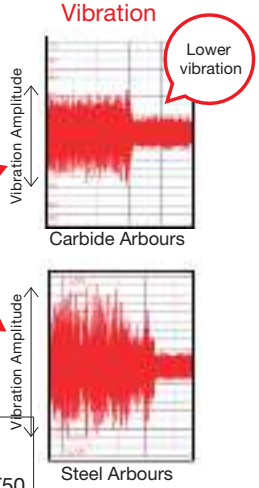
● Carbide arbors achieve greater precision and stable milling compared to steel arbors



● Machined Wall Precision



Vibration



Work Material : 1050
Tool : WEX2025M12Z4 (ø25 x 4-flute)
Cutting Conditions: v_c = 328 SFM f_z = 0.004in/t a_e = 3.15in x 3 times a_p = 0.08in Machine: Machining center BT50

· The above recommended cutting conditions may require adjustment depending on machine rigidity and work rigidity. The above figures are guidelines for use with BT50 machine tools.

· The above recommended cutting conditions assume a tool overhang length of L/D=3 (i.e. overhang length of 3 times tool diameter) or less.
When tool overhang is more than L/D = 3 and less than or equal to L/D=5, settings should be adjusted to approximately 70 to 80% of those indicated in the above recommended cutting conditions (i.e. a_p and Feed Rate).
When tool overhang is more than L/D = 5 and less than or equal to L/D=8, settings should be adjusted to approximately 50 to 60% of those indicated in the above recommended cutting conditions (i.e. a_p and feed rate).

GFX Type / GFS Type / GRHN Type

■ General Features

SEC-Goal Mill Series cutters have been developed for high-efficiency machining and finishing of cast iron parts (such as engine cylinder blocks and transmission cases).

■ Features

- Special cutters for high-feed machining of cast iron
- Multi-teeth design (approx. 3 teeth per inch)
- Finishing cutters feature an easy-to-use function for edge runout fine adjustment
- Highly reliable cutter with tangential inserts for finishing
- Chipbreaker type inserts for low cutting force

■ Product Range

Series Code	GFX	GFS	GRHN
Applications	Finishing	Finishing / Shoulder Milling	Roughing
Surface Roughness	< Ra3.2	< Ra3.2	< Ra12.5
Appearance	 →H226 to H227	 →H228	 →H229 to H230

Refer to the QC system on pages H238 to H239 for details and specifications on the two-piece mounting system and adapter.

■ Grade Characteristic Values

Classification	Grade	Hardness	Transverse Rupture Strength (GPa)	Main Coating Components	Coating Thickness (μm)	Features
K Cast Iron	ACK260	92.6HRA	2.6	Super ZX Coat	3	· From finishing to general machining of cast iron and ductile cast iron. · Employs new super multi-layered PVD coating consisting of nanometre-thin layers of TiAlN and AlCrN. Combines with a tough, thermal-resistant substrate for long and stable tool life.
K Cast Iron	ACK280	91.7HRA	3.0	Super ZX Coat	3	· For heavy interrupted cutting and wet cutting of cast iron and ductile cast iron. · Employs new super multi-layered PVD coating consisting of nanometre-thin layers of TiAlN and AlCrN. · Coupled with an ultra-tough substrate for superior fracture resistance and thermal crack resistance during wet cutting.

ACK100, ACK200, ACK300 Characteristic Values ☞H13

■ Application Examples

Application: Finishing

• Workpiece: Side Face of Cylinder Block		SEC-Goal Mill	Competitor's Product
Work Material: **Gray Cast Iron** Roughness Standard: Rz **12.5**µm Machine: Horizontal Machining Centre	Tool	**GFXC13100R**	ø100
	Grade	**BN7000**	CVD
	Tool Shape	Tangential Screw Locked	Wedge Type
	Number of Teeth	4	10
	v_c (m/min)	1,200	251
	v_f (mm/min)	10,000	500
	f_z (mm/t)	0.65	0.063
	a_p (mm)	0.5	0.5
	Coolant	Dry	Dry
	Results	· v_f = 10,000mm/min can be realised · Achieves a v_f value 20 times larger than our competitors' products	

Application: Finishing

• Workpiece: Side Face of Cylinder Head		SEC-Goal Mill	Competitor's Product
Work Material: **Gray Cast Iron** Roughness Standard: Rz **12.5**µm Machine: Horizontal Machining Centre	Tool	**GFXC13125R**	ø125
	Grade	**BN7000**	PVD
	Tool Shape	Tangential Screw Locked	Horizontal Screw Locked
	Number of Teeth	4	12
	v_c (m/min)	1,000	216
	v_f (mm/min)	6,000	376
	f_z (mm/t)	0.59	0.057
	a_p (mm)	0.5	1.0
	Coolant	Dry	Dry
	Results	· v_f = 6,000mm/min can be realised · Improves efficiency by 16 times and provides better surface roughness than our competitors' products	

Application: Finishing

• Workpiece: Bottom Face of Cylinder Block		SEC-Goal Mill	Conventional Tool
Work Material: **Gray Cast Iron** Roughness Standard: Ra **6.3**µm Machine: Horizontal Machining Centre	Tool	**GFXC13125R**	ø125
	Grade	**ACK260**	CBN
	Tool Shape	Tangential Screw Locked	Wedge Type
	Number of Teeth	10	4
	v_c (m/min)	250	510
	v_f (mm/min)	1,020	1,020
	f_z (mm/t)	0.16	0.20
	a_p (mm)	0.5	0.5
	Coolant	Wet	Wet
	Results	· Carbide tools providing a tool life as long as CBN cutters · Reduces costs	

Application: Finishing

• Workpiece: Bottom Face of Cylinder Block		SEC-Goal Mill	Competitor's Product
Work Material: **Gray Cast Iron** Roughness Standard: Ra **3.2**µm Machined: Special Machine	Tool	**GFX16315R** (Special Type)	ø315
	Grade	**ACK260**	PVD
	Tool Shape	Tangential Screw Locked	Wedge Type
	Number of Teeth	44 (Effective)	40
	v_c (m/min)	148	148
	v_f (mm/min)	720	720
	f_z (mm/t)	0.11	0.12
	a_p (mm)	0.5	0.5
	Coolant	Dry	Dry
	Results		
	Evaluation	Provides a tool life approximately 1.5 times longer than that of our competitors' products	

Application: Finishing

• Workpiece: Lathe Bed		SEC-Goal Mill	Competitor's Product
Work Material: **Gray Cast Iron** Roughness Standard: Ra **6.3**µm Machine: Double Column Machining Centre	Tool	**GFX16125R**	ø125
	Grade	**ACK260**	Ceramics
	Tool Shape	Tangential Screw Locked	–
	Number of Teeth	16	10
	v_c (m/min)	300	785
	v_f (mm/min)	3,057	3,000
	f_z (mm/t)	0.25	0.15
	a_p (mm)	0.3	0.3
	Coolant	Dry	Dry
	Results	Equivalent v_f value to ceramics achieved with carbide	
	Evaluation	Reduced running costs	

Application: Roughing

• Workpiece: Printer Roller		SEC-Goal Mill	Competitor's Product
Work Material: **Nodular Iron** Machine: Horizontal Machining Centre	Tool	**GRHNM17080R**	ø80
	Grade	**ACK200**	PVD
	Tool Shape	Screw-Fastened	Screw-Fastened
	Number of Teeth	8	9
	v_c (m/min)	230	151
	v_f (mm/min)	732.5	541
	f_z (mm/t)	0.1	0.1
	a_p (mm)	3 to 5	3 to 5
	Coolant	Dry	Dry
	Results	· Achieves 1.4 Times Machining Efficiency	

Application: Roughing

• Workpiece: Machine Tool Parts		SEC-Goal Mill	Competitor's Product
Work Material: **FC300** Machine: Double Column Machining Centre	Tool	**GRHNM17160R**	ø160
	Grade	**ACK200**	CVD
	Tool Shape	Screw-Fastened	Wedge Type
	Number of Teeth	16	8
	v_c (m/min)	250	140
	v_f (mm/min)	1,780	549
	f_z (mm/t)	0.20	0.245
	a_p (mm)	3→5→2	3→5→2
	Coolant	Dry	Dry
	Results	· Achieves 3.2 Times Machining Efficiency	

■ Application Examples

Application: Finishing

• Workpiece: Housing		SEC-Goal Mill	Competitor's Product
Work Material: **Gray Cast Iron** Roughness Standard: Ra **1.6**µm Machine: Horizontal Machining Centre	Tool	**GFXC13100R**	ø100
	Grade	**ACK260**	CVD
	Tool Shape	Tangential Screw Locked	Horizontal Screw Locked
	Number of Teeth	8	10
	v_c (m/min)	250	250
	v_f (mm/min)	960	530
	f_z (mm/t)	0.15	0.066
	a_p (mm)	0.1	0.1
	Coolant	Dry	Dry
	Results	· Provides higher efficiency and accuracy, and visually better than our competitors' products · Achieves a tool life that is over 2.5 times longer than that of our competitors' products	

Application: Finishing

• Workpiece: Large Diesel Engine (Base Plate)		SEC-Goal Mill	Current Tool
Work Material: **Gray Cast Iron** Roughness Standard: Ra **3.2**µm Size: **1,600**mm x **1,800**mm Machine: Horizontal Machining Centre	Tool	**GFX16160R**	ø160
	Grade	**ACK260**	CBN
	Tool Shape	Tangential Screw Locked	Blade Type
	Number of Teeth	20	10
	v_c (m/min)	300	980
	v_f (mm/min)	2,980	1,950
	f_z (mm/t)	0.25	0.10
	a_p (mm)	0.3	0.3
	Coolant	Dry	Dry
	Results	Carbide tools achieve 1.5 times the efficiency of CBN and provide machined surfaces equivalent to those machined with CBN on visual inspection	

Application: Finishing

• Workpiece: Side of Lathe Bed (11m Overall Length)		SEC-Goal Mill	Competitor's Product
Work Material: **Gray Cast Iron** Roughness Standard: Ra **3.2**µm Machine: Double Column Machining Centre	Tool	**GFX16160R**	ø160
	Grade	**ACK260**	CVD
	Tool Shape	Tangential Screw Locked	Horizontal Screw Locked
	Number of Teeth	20	8
	v_c (m/min)	120	125
	v_f (mm/min)	477	400
	f_z (mm/t)	0.10	0.20
	a_p (mm)	0.3	0.3
	Coolant	Dry	Dry
	Results	Tool / Cutting Length / Corner (20m, 40m) GFX Type: 40m Competitor's Product: 10m	
	Evaluation	Provides a cutting length 4 times longer than that of our competitors' products	

Application: Finishing

• Workpiece: Angle Plate		SEC-Goal Mill
Work Material: **Gray Cast Iron** Roughness Standard: Ra **3.2**µm Machine: Horizontal Machining Centre	Tool	**GFS13125R**
	Grade	**ACK260**
	Tool Shape	Tangential Screw Locked
	Number of Teeth	6
	v_c (m/min)	137
	v_f (mm/min)	1,000
	f_z (mm/t)	0.47
	a_p (mm)	0.015
	Coolant	Dry
	Results	Surface Roughness: Ra **1.0**µm No Step Final Grinding Omitted

Application: Finishing

• Workpiece: Hydraulic Component		SEC-Goal Mill	Competitor's Product
Work Material: **Nodular Iron** Roughness Standard: Ra **3.2**µm Machine: Horizontal Machining Centre	Tool	**GFX13080R**	ø80
	Grade	**ACK260**	PVD
	Tool Shape	Tangential Screw Locked	Vertical Drawing Pins
	Number of Teeth	8	6
	v_c (m/min)	218	180
	v_f (mm/min)	1,600	650
	f_z (mm/t)	0.23	0.15
	a_p (mm)	0.1	0.1
	Coolant	Wet	Wet
	Results	Tool / Workpieces/Corner (50, 100, 150) GFX Type: 148 Units Competitor's Product: 100 Units	
	Evaluation	Provides a tool life approximately 1.5 times longer than that of our competitors' products	

Application: Finishing

• Workpiece: Rear Hub Carrier		SEC-Goal Mill	Current Tool
Work Material: **Nodular Iron** Roughness Standard: Rz **25**µm Machine: Horizontal Machining Centre	Tool	**GFX16100R**	ø100
	Grade	**ACK260**	CVD
	Tool Shape	Tangential Screw Locked	Wedge Type
	Number of Teeth	12	14
	v_c (m/min)	250	150
	v_f (mm/min)	3,150	800
	f_z (mm/t)	0.33	0.12
	a_p (mm)	0.5-1.0	0.5-1.0
	Coolant	Wet	Wet
	Results	· Current tools make steps in machined surfaces. · Efficiency improved.	

Application: Finishing

• Workpiece: Hydraulic Component		SEC-Goal Mill	Conventional Tool
Work Material: **Ductile Iron** Roughness Standard: Ra **1.6**µm Machine: Horizontal Machining Centre	Tool	GFX16125R (Special Type)	ø125
	Grade	**ACK260**	PVD
	Tool Shape	Tangential Screw Locked	Wedge Type
	Number of Teeth	6	6
	v_c (m/min)	160	150
	v_f (mm/min)	733	110
	f_z (mm/t)	0.30/1.20	0.05
	a_p (mm)	0.25	0.25
	Coolant	Wet	Wet
	Results	Tool / Tool Life / Corner (200min., 400min.) GFX Type: 350min Conventional Tool: 150min	
	Evaluation	Provides tool life approximately 2.3 times longer than conventional tools	

Application: Simultaneous Finishing

• Workpiece: Crank Case		SEC-Goal Mill	Competitor's Product
Work Material: **Al** + **Gray Cast Iron** Roughness Standard: Ra **3.2**µm Machine: Vertical Machining Centre	Tool	**GFX13100R**	ø100

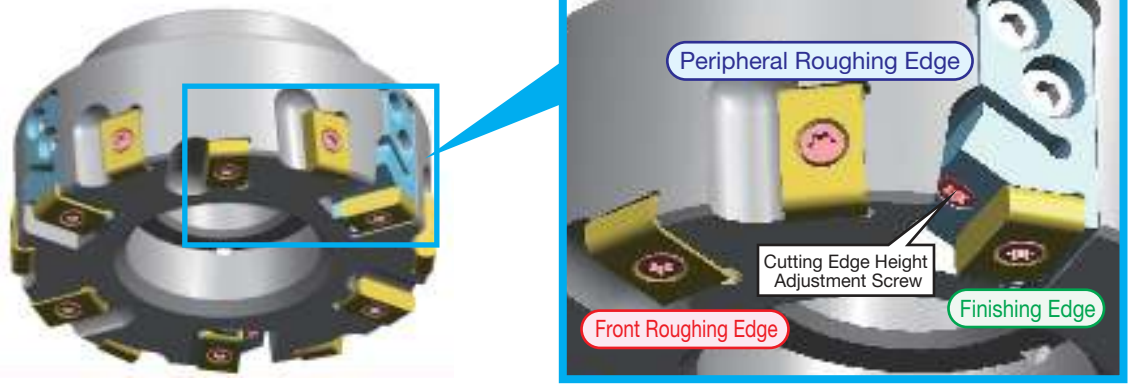
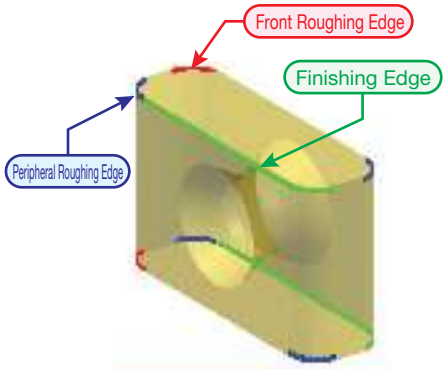
■ GFX Type Features

● Simple Runout Adjustment

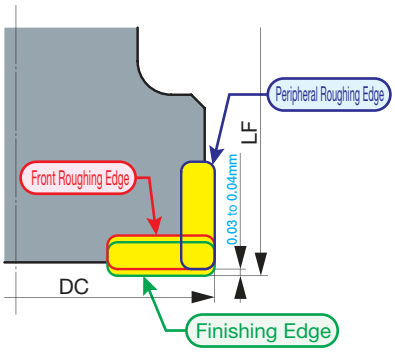


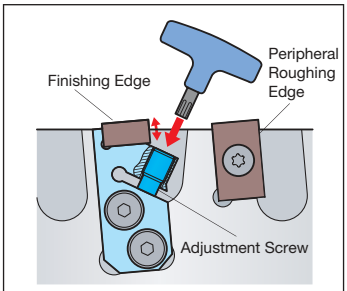
Finishing edge runout can be adjusted by 5μm or less simply by turning the adjustment screw.

● Economical 8-Cornered Insert



Arraying the same number of vertical and horizontal inserts allows 8-corner configuration.



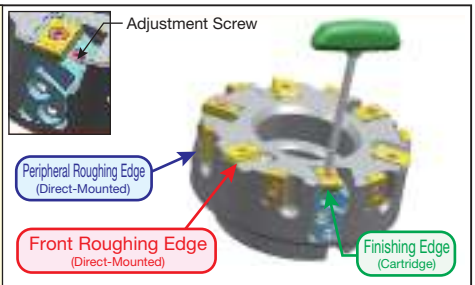


Finishing Edge Adjustment on GFX Type

■ GFX Type Finishing Edge Runout Adjustment Procedure

(1) Insert Assembly

Attach insert to cutter body.
When doing so, check that the cartridge adjustment screw is completely loose.

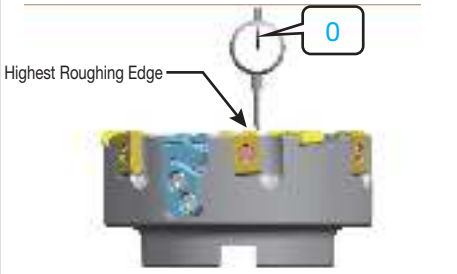


(2) Check Roughing Edge Runout

Measure face runout of the roughing edge and check the cutting edge that protrudes the most.

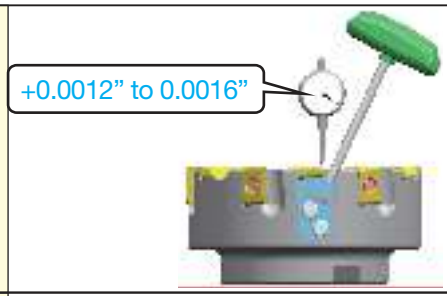
(3) Set Reference Roughing Edge

Set "0" as the cutting edge height checked in (2).



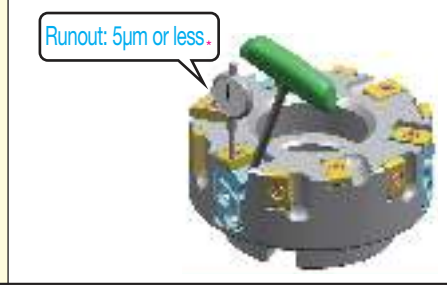
(4) Adjust Finishing Edge Height

Select a finishing edge and adjust with the adjustment screw so that the edge protrudes around 0.0012" to 0.0016" further than (3).



(5) Adjust Runout

With the finishing edge from (4) as a reference, adjust the position of the other finishing edges so that runout is equal to or less than 5 μm.



⚠

· Always adjust finishing edge height before use.

· Using the tool with the adjustment screw loose may result in tool breakage.

* Adjusting finishing edge runout to 2μm or less will result in a better machined surface.

Precautions for Use of GFXC Type

GFXC Type can be used with fewer teeth attached. In this case, only mount inserts to the mounting positions with markings. Remove the screws from the mounting positions where inserts will not be mounted.

No. of GFXC type inserts for all teeth mounted versus mounted number of teeth reduced.

Cat. No.	Diameter DC	Total No. of Teeth	Mounted No. of Teeth Reduced
GFXC 13063RS/LS	63mm	4	**2**
13080R/L	80mm	6	**2**
13100R/L	100mm	8	**4**
13125R/L	125mm	10	**4**

Cat. No.	Diameter DC	Total No. of Teeth	Mounted No. of Teeth Reduced
GFXC 13160R/L	160mm	12	**6**
13200R/L	200mm	16	**8**
13250R/L	250mm	20	**10**
13315R/L	315mm	24	**12**

The number of inserts mounted should always match either the "Total No. of Teeth" or "Mounted No. of Teeth Reduced" quantities.

Recommended Cutting Conditions

SN2100K	1000~3000	0.010~0.080	0.004~0.010				

*Greater depths of cut (up to 4mm) possible if wiper cartridges are removed.

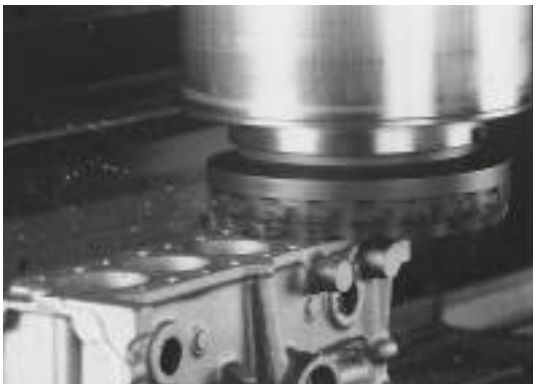
Recommended Cutting Conditions - BN7000

ISO	Work Material	Hardness	Cutting Speed v_c (m/min) Min. - **Optimum** - Max.	Feed Rate f_z (mm/t) Min. - **Optimum** - Max.	Insert Grade
K	Cast Iron	250HB	800- **1,000** -1,200	0.1- **0.3** -0.5	BN7000

Note: Calculate cutting conditions based on effective no. of teeth.

NOTE: If the wiper inserts will be indexed without presetting the wiper cartridge heights again, the first preset height should be from 0.001" to 0.002" (0.025 to 0.050 mm) above the highest fixed pocket periphery insert.

High-Feed Facemills



■ General Features

Sumitomo Electric Hardmetal SEC-High Feed facemills achieve high-performance milling particularly suited for cast irons, aluminum and light alloys. Cutting edge reference system design is rugged, simple and easy to maintain.
A range of facemills are available to suit various applications.

■ Series Common Features

- Dedicated cutter for high-feed machining of cast iron and light alloys
- Cutting edge reference system provides simple, easy and fast runout management. (→H233)
- Fine pitch cutter design (*3 teeth per inch) is ideal for high-efficiency machining

  Cutting edge O.D. inch conversion (example: ø100 ≈ 4 inches x 3 = 12 blades)
- An excellent range of cutter designs and insert grades to suit various applications
- Quick change system enabling fast replacement of cutter (→H238)

	Cat. No.	Specifications	Applicable Cutter Size
(1)	F Type/NF Type*	Quick Change System	ø160mm and below
(2)	2-piece type	2-piece set indication	ø200mm and above
(3)		Two-piece cutter with centre bolt	

* The Quick Change System NF type is a made-to-order item. For details, please contact us directly.

Cutting Edge Reference System

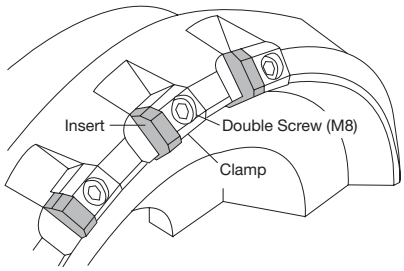
■ General Features

Conventional indexable cutters are designed to position and clamp two or three faces of the insert with locators, etc. The cutting edge reference cutter, on the other hand, retains the insert only with a clamp. (See Fig. 1) This system is adopted for our entire high-feed cutter series.

■ Features of the Cutting Edge Reference Cutter

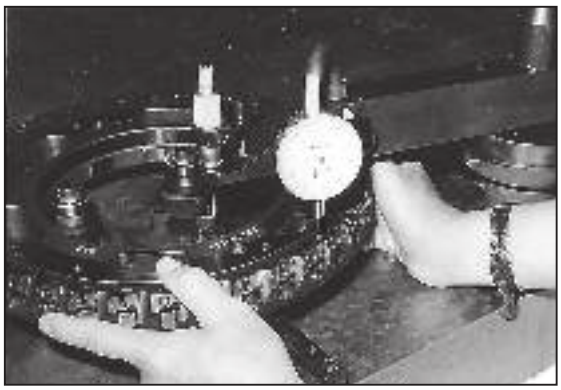
- Axial runout of the inserts is kept within 5 to 10μm to ensure stable surface roughness and longer tool life.
- Simple design with fewer parts compared to the locator type facilitates cleaning the typical cast iron machining dirt and is comparatively inexpensive.
- Fewer parts allow high-density cutter design, higher machining efficiency and longer tool life.

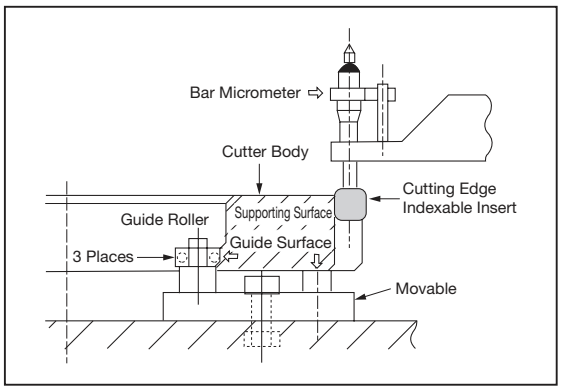
Fig. 1



■ Assembly Jig

Application of a special assembly jig (as shown in the figure below) is recommended to accurately assemble the cutting edge reference cutter.





■ Insert Assembly Guidelines

When mounting (assembling) the inserts, pay careful attention to the points noted below in .

450	300	420	**63.50**	32	22	350	6	ø450

● Features and Applications

(1) Lightweight ring cutter body.
(2) Cutter can be changed without removing the bolt.
(3) A tapered spline system is used to connect the adapter to the cutter.
(4) Can be used for cutters over ø200.
(5) Effective when mounting several cutter body sizes on the same adapter.

450	355	440	**63.50**	32	22	405	ø450

● Features and Applications

(1) With one clamping bolt, the total weight of the two-piece cutter is lighter.
(2) Cutter can be replaced quickly - simply turn one bolt halfway to mount and remove.
(3) A tapered spline system is used to connect the adapter to the cutter.
(4) Can be used for cutters over ø200.

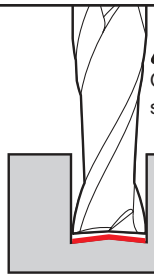
Material Selection Guide

Target Material (What to machine?)	Cutting Applications	Recommended Tool	Ref. Page
Steel, Cast Iron, Stainless Steel, Titanium Alloy	High Efficiency Machining Chatter Countermeasures	GSXVL GSV	I76,I78 I74
	Medium Finishing to Finishing (Good Machining Accuracy)	GSX	I40 to I72
	Roughing (Large Stock Removal)	GSXVL	I76,I78
Aluminum Alloy	All Aluminum Alloys	ASM	I82 to I84

Target Material (What to machine?)	Cutting Applications	Recommended Tool	Ref. Page
Steel, Cast Iron, Stainless Steel, Titanium Alloy	High Efficiency Machining Chatter Countermeasures	GSXVL GSV	I76,I78 I92
	Medium Finishing to Finishing (Good Machining Accuracy)	GSX	I90
	Roughing (Large Stock Removal)	GSXVL	I76,I94
	Stainless Steel, Titanium Alloy	SSEH SSEHVL	I102,I104 I98,I100

Target Material (What to machine?)	Cutting Applications	Recommended Tool	Ref. Page
Steel, Cast Iron, Stainless Steel, Titanium Alloy	General Machining	GSXB	I27, I112
Aluminum Alloy Copper Alloy	All Aluminum Alloys, Copper	SNB	I115, I116



Our square endmill cutting edge shapes have concave ends.

Therefore, they do not make flat bottoms in spot facing.

If a flat bottom is required, we recommend using the **Flat Bottom MDF**.

Endmill Coating

■ Endmill Coating

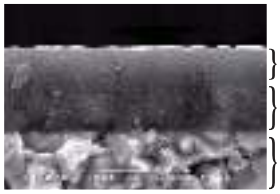
Coating Name	GSX Coat	ZX Coat	AURORA Coat	SUMIDIA Coat
Coating Type	TiAlCrN Type	TiAlN Type	DLC	Diamond
Wear Resistance	◎	○	○	◎
Adhesion Resistance	◎	○	◎	△
Thermal Resistance	◎	○	△	○
Coating Thickness	up to 2μm	up to 2μm	up to 0.5μm	up to 15μm
Features	Excellent thermal resistance and adhesion resistance	General-purpose	Low coefficient of friction and excellent adhesion resistance	Excellent hardness and wear resistance
Main Application	For general steel and stainless steel milling	For general steel and cast iron milling	For aluminum alloy and copper alloy milling	Milling of CFRP
Main Applicable Products	GSX/GSXB/GSXVL Type	UPMILL Type	ASM/SNB/SNB2 Type	SSDC Type

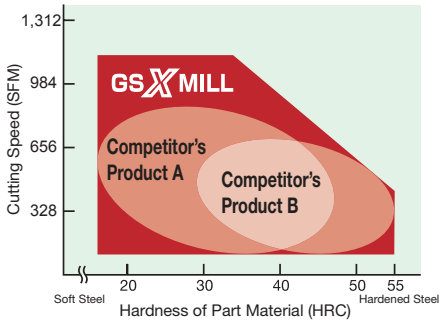
● GSX Coat

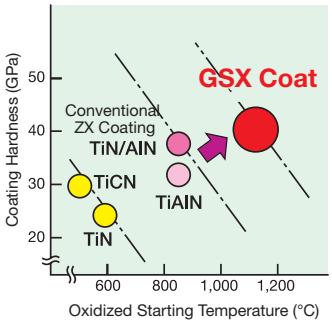
GSX Coat

- Micro-grain carbide substrate provides high transverse rupture strength and excellent thermal shock resistance, improving reliability in wet cutting applications.
- Adopts GSX Coat for better wear resistance and thermal resistance, improving reliability and tool life when machining a wide range of work materials.

[Coating Structure]



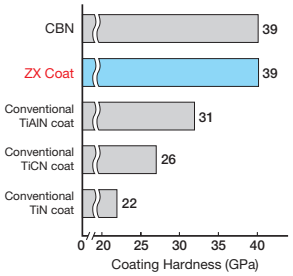


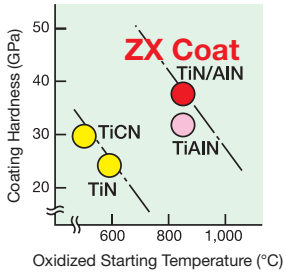


● ZX Coat

ZX Coat

- Hardness almost equivalent to that of CBN
- Improvement in wear resistance, oxidation resistance and peel-off resistance
- Approx. 6 times longer tool life compared with uncoated products





● AURORA Coat

Aurora DLC Coating

- Very smooth AURORA COAT results in low adhesion as well as good surface finish
- Low cutting force enables high feed machining and milling of low rigidity workpieces
- Ideal for machining non-ferrous metal/copper electrodes

AURORA Coat

Competitor's Diamond Coating

● SUMIDIA Coat

SUMIDIA Coat

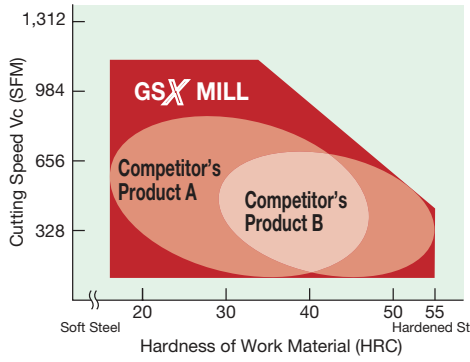
- Our original polycrystalline diamond coating technology achieves over 10 times higher wear resistance than uncoated carbide.
- Provides a micro-grain diamond film that provides the required combination of high strength and high wear resistance on smooth surfaces for CFRP milling

GSX MILL Series

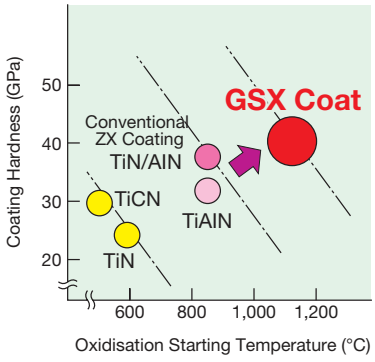
■ Features and Applications

- A wide selection from 3 types of cutting flute configuration and 4 cutting lengths to cover a wide range of applications.
- Micro-grain carbide substrate provides high transverse rupture strength and excellent thermal shock resistance, improving reliability in wet cutting applications
- GSX Coat has increased wear resistance and thermal resistance for improved reliability and longer tool life
- Large rake angle and unique flute design improve sharpness and chip evacuation
- Cutting teeth with gash land improve corner cutting edge strength
- New lineup of radius types and 4D size S types

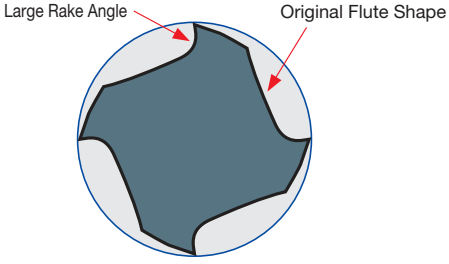
● Wear resistance



● Thermal resistance



● Improved chip evacuation

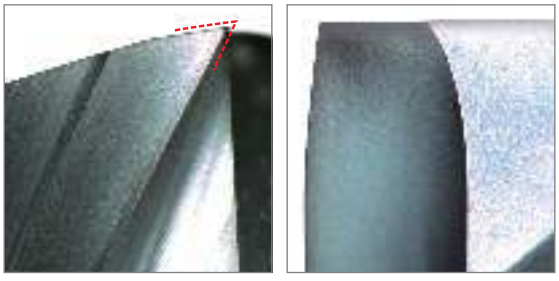


Large rake angle combined with our unique flute design improves sharpness and chip evacuation

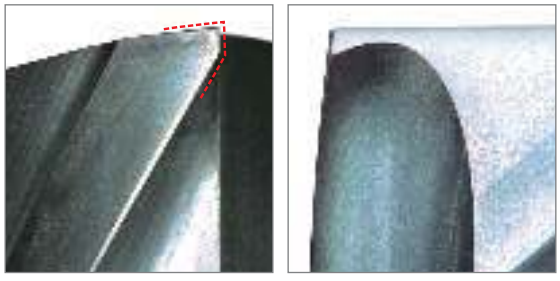
■ 2 cutting edge shapes, expanding machining applications

Sharper edge S type and fracture-resistant C type added to the 2D size series.

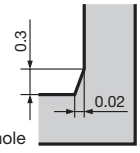
S Type — Sharp Corner: Sharper Edge Design



C Type — Gash Land: Fracture-Resistant Design



Note: When using endmills with gash land, some material remains as shown at right.
If you need sharp corners, use the S type.



Example: Corner on a ø10mm hole (Unit: mm)

■ Part Material

Radius	4 Flutes		GSX40000-R-2D ø3.0 to ø12.0mm					

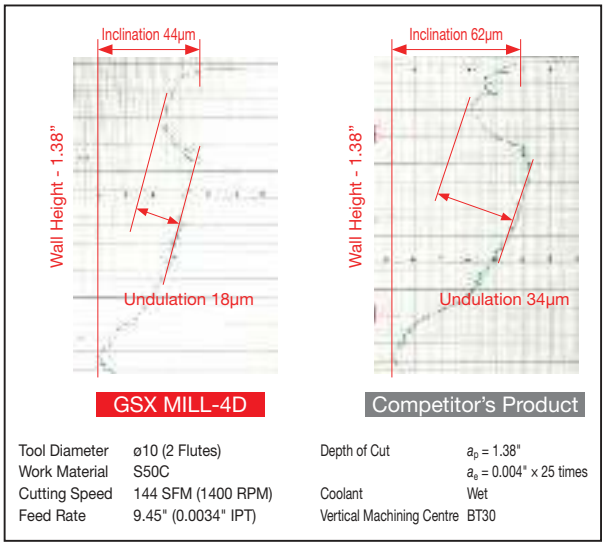
■ High Precision

- Diametrical tolerance decreased to 2/3 of the previous type. Also features reduced variation and does not require tool diameter correction when replacing tools.

■ Multi-Purpose

- Optimized flute design of slotted 3 flute (short) type reduces cutting force.
  (1) Allows drilling, slot milling and other continuous (compound) applications
  (2) Perfect for use with thin sheets and small machining centers.

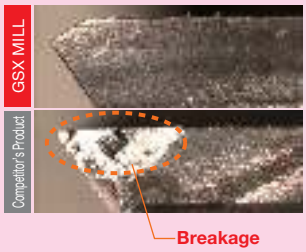
■ Long, High Rigidity Flutes (C Type)



Tool Diameter	ø10 (2 Flutes)	Depth of Cut	a_p = 1.38"
Work Material	S50C		a_e = 0.004" × 25 times
Cutting Speed	144 SFM (1400 RPM)	Coolant	Wet
Feed Rate	9.45" (0.0034" IPT)	Vertical Machining Centre	BT30

■ Application Examples

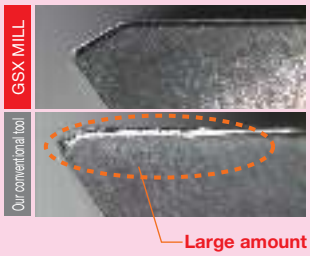
● Carbon Steel Groove Milling with GSX20000C



Gash land for stronger cutting edge.

Tool Diameter	ø6 (2 Flutes)
Part Material	1050 Steel
Cutting Speed	285 SFM (4,615 RPM)
Feed Rate	21.78" IPM (0.0024" IPT)
Depth of Cut	a_p = 0.118"
	a_e = 0.236"
Coolant	Dry
Vertical Machining Centre	BT50

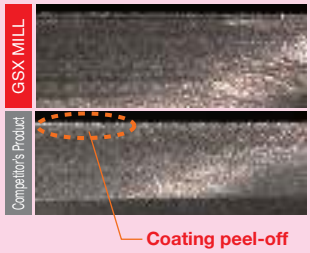
● Cast Iron Groove Milling with GSX20000C



GSX coat for improved wear resistance.

Tool Diameter	ø10 (2 Flutes)
Part Material	Cast Iron - FCD600
Cutting Speed	217 SFM (2,100 RPM)
Feed Rate	11.89" IPM (0.0028" IPT)
Depth of Cut	a_p = 0.197" x 5 times
	a_e = 0.394"
Coolant	Dry
Vertical Machining Centre	BT40

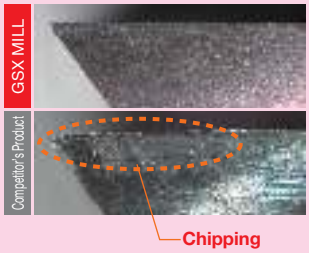
● Stainless Steel Machining with GSX20000C



Improved reliability even under wet machining.

Tool Diameter	ø10 (2 Flutes)
Part Material	304 Stainless
Cutting Speed	164 SFM (1,591 RPM)
Feed Rate	5.00" IPM (0.0016" IPT)
Depth of Cut	a_p = 0.394"
	a_e = 0.0197"
Coolant	Wet
Vertical Machining Centre	BT50

● 1050 Steel Side Milling with GSX20000S



The S type delivers optimum sharpness.

Tool Diameter	ø6 (2 Flutes)
Part Material	1050 Steel
Cutting Speed	285 SFM (4,615 RPM)
Feed Rate	21.8" IPM (0.0024" IPT)
Depth of Cut	a_p = 0.394"
	a_e = 0.012"
Coolant	Dry
Vertical Machining Centre	BT50

GSX MILL Series

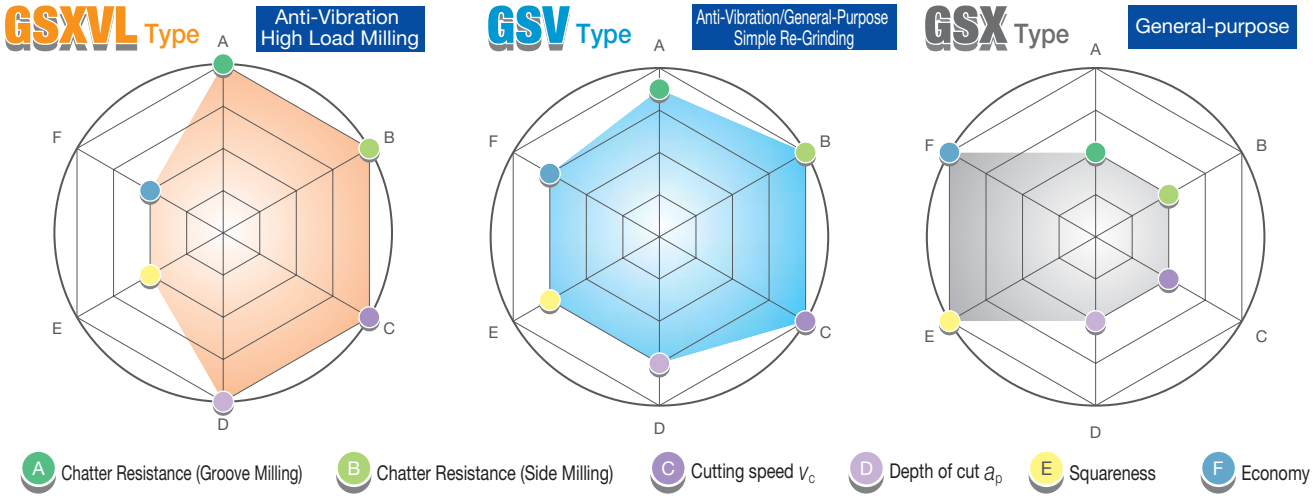
■ Recommended Milling Examples

Application	Side Milling		Groove Milling		Groove Finishing	
	Roughing	Finishing	Roughing	Finishing	Roughing	Finishing
GSXVL Type	◎	○	◎	◎	◎	○
GSV Type	◎	◎	○	◎	◎	○

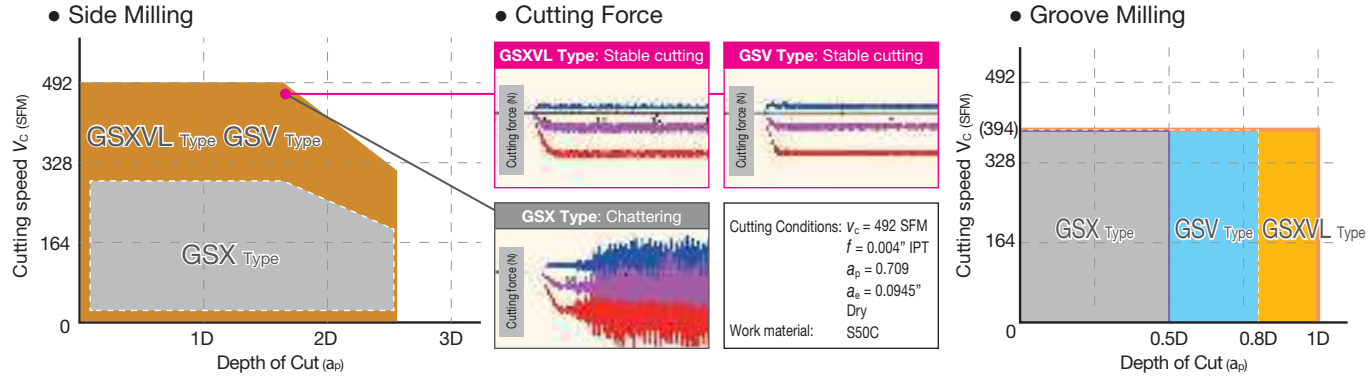
■ Diameter

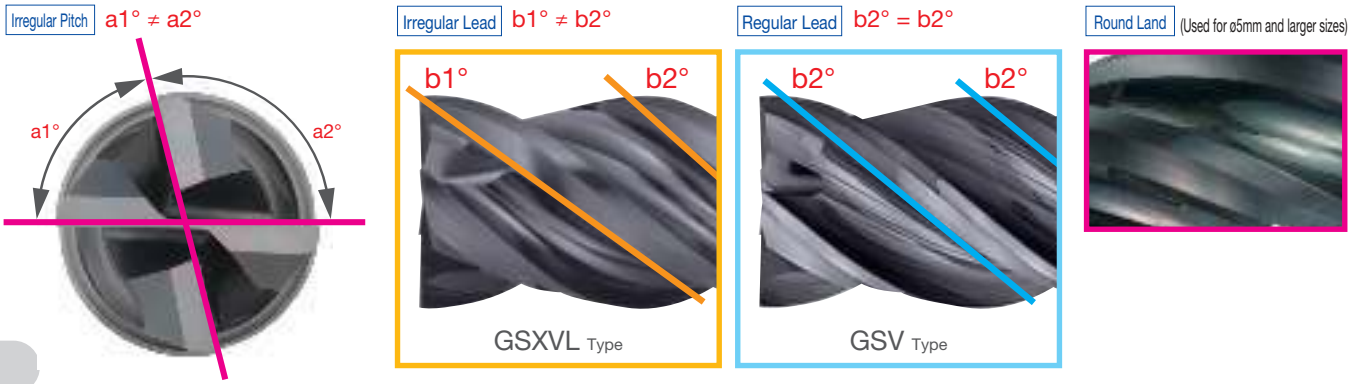
■ Differentiating GSXVL / GSV Type Use

GSXVL types exhibit outstanding performance for high load milling. GSV types are both chatter-resistant and economical.

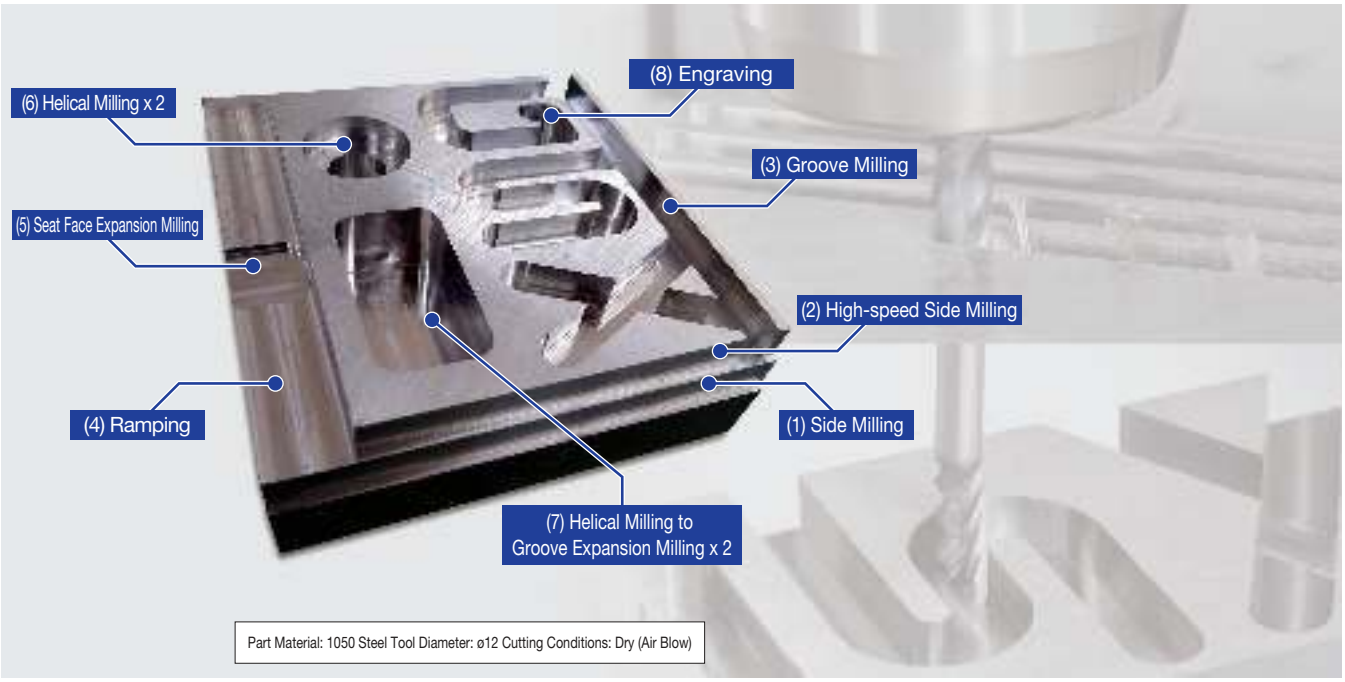


■ Cutting Range



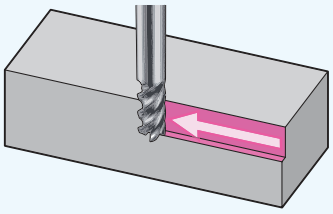


■ Application Examples



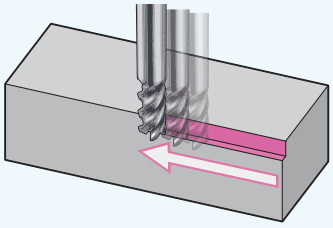
Part Material: 1050 Steel Tool Diameter: ø12 Cutting Conditions: Dry (Air Blow)

(1) Side Milling GSXVL Type ◯ / GSV Type ◎



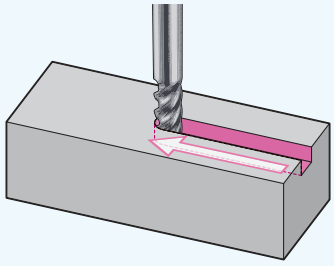
Cutting Conditions: V_c = 335 SFM (n = 4,100 RPM) Tool Diameter: ø8
V_f = 42.52" IPM (0.004" IPT)
a_p = 0.945", a_e = 0.787"

(2) High-speed Side Milling GSXVL Type ◎ / GSV Type ◎



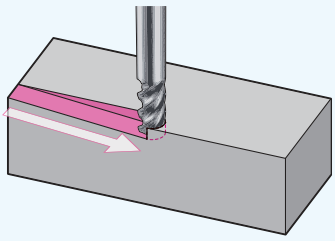
Cutting Conditions: V_c = 945 SFM (n = 4,000 RPM) Tool Diameter: ø12
V_f = 189" IPM (0.012' IPT)
a_p = 0.472" , a_e = 0.787"

(3) Groove Milling GSXVL Type ◎ / GSV Type ◯



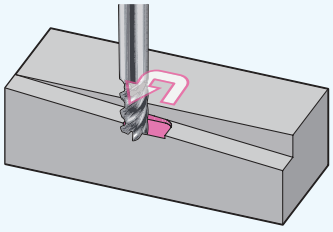
Cutting Conditions: V_c = 295 SFM (n = 2,400 RPM) Tool Diameter: ø12
V_f = 37.80" IPM (0.004" IPT)
a_p = 0.472"

(4) Ramping GSXVL Type ◎ / GSV Type ◯



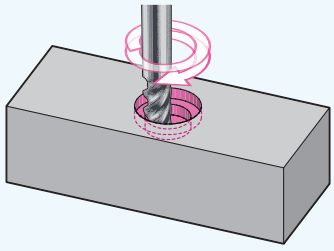
Cutting Conditions: V_c = 295 SFM (n = 2,400 RPM) Tool Diameter: ø12
V_f = 18.90" IPM (0.002" IPT)
Ramp Angle 5°

(5) Seat Face Expansion Milling GSXVL Type ◎ / GSV Type ◎



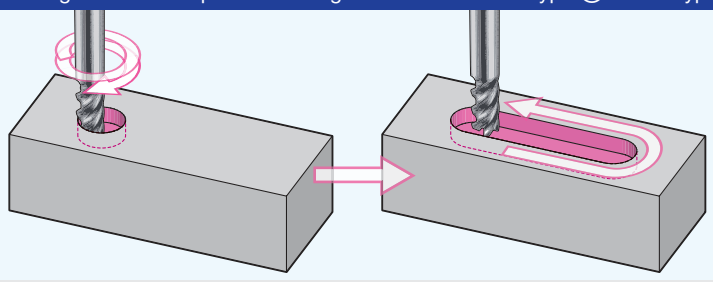
Cutting Conditions: V_c = 295 SFM (n = 2,400 RPM) Tool Diameter: ø12
V_f = 37.80" IPM (0.004" IPT)

(6) Helical Milling x 2 GSXVL Type ◎ / GSV Type ◎



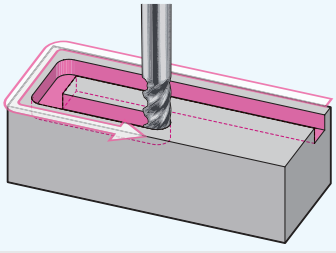
Cutting Conditions: V_c = 295 SFM (n = 2,400 RPM) Tool Diameter: ø12
V_f = 18.90" IPM (0.002" IPT)
Ramp Angle 3°

(7) Helical Milling to Groove Expansion Milling x 2 GSXVL Type ◎ / GSV Type ◎



Cutting Conditions: V_c = 295 SFM (n = 2,400 RPM) Tool Diameter: ø12
[Helical] V_f = 18.90" IPM (0.002" IPT) [Groove Expansion] V_f = 26.46" IPM (0.0028" IPT) [Finishing] V_f = 75.59" IPM (0.0079" IPT)
Ramp Angle 3°
a_p = 0.945", a_e = 0.004"

(8) Engraving GSXVL Type ◎ / GSV Type ◯



Cutting Conditions: V_c = 259 SFM (n = 2,100 RPM[1]) Tool Diameter: ø12
V_f = 23.19" IPM (0.0028" IPT)
a_p = 0.472"

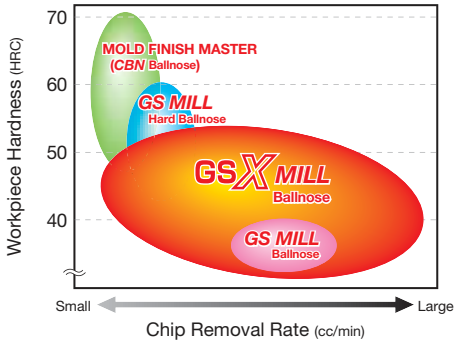
Application	Radius Milling		Profiling		Pocketing	
	Roughing	Finishing	Roughing	Finishing	Roughing	Finishing
Ballnose Type	◎	◎	◎	◎	◎	◎

■ Diameter

■ Improved Thermal Resistance and Wear Resistance

New coating combined with an ultra-fine grain carbide substrate for better thermal and wear resistance.

■ Application Range

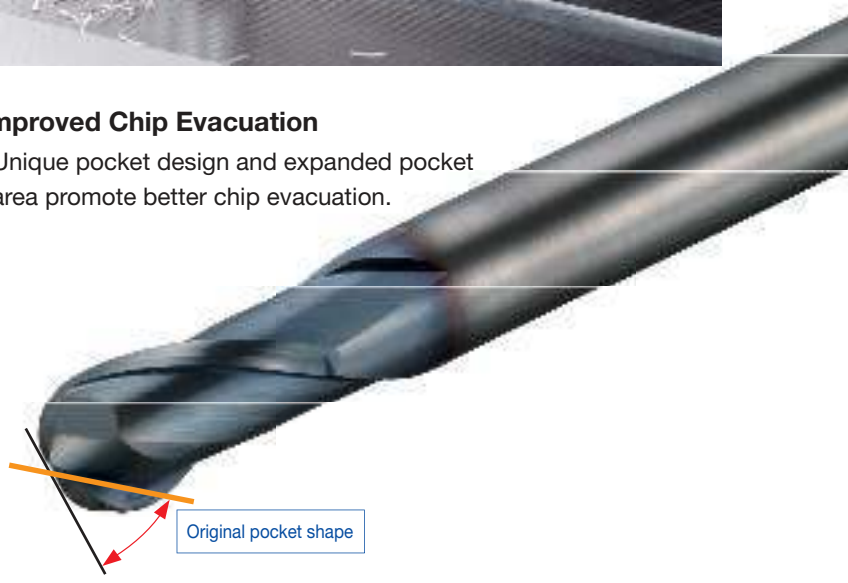


■ Reduced Cutting Force

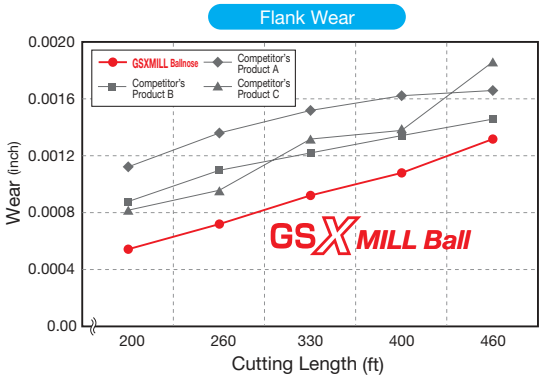
Large helix angle on curved cutting edge reduces cutting force

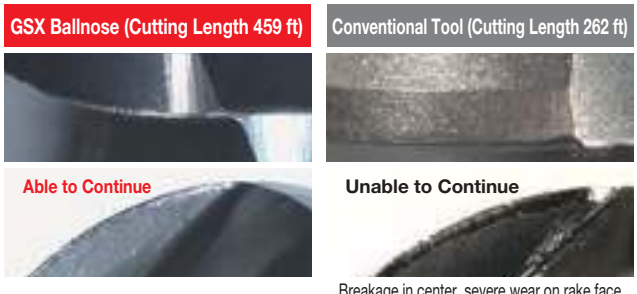
■ Improved Chip Evacuation

Unique pocket design and expanded pocket area promote better chip evacuation.



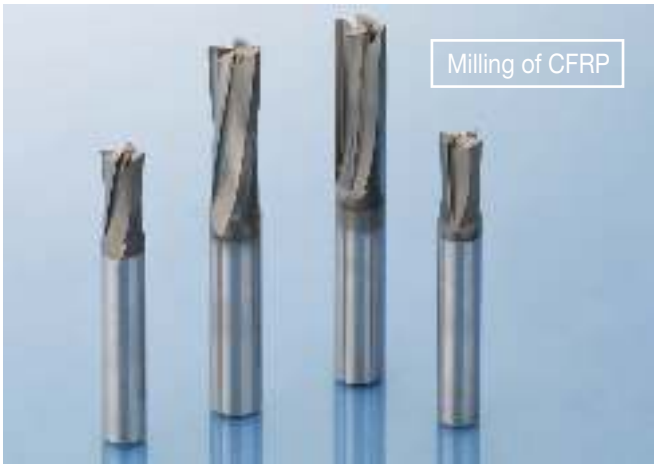
■ Application Examples





Part Material: H13 Tool Steel (50HRC)
Tool Diameter: R3 (2 Flutes)
Cutting Conditions: v_c = 587 SFM (n = 9,500 RPM), v_f = 88.58" IPM (f_z=0.0047" IPT)
a_p = 0.0787"~0.0393", p_f = 0.0118" Wet
Equipment: Vertical Machining Center BT40

SUMIDIA Coated SSDC Type Series



I89

■ Product Range

Cat. No.	Number of teeth	Shape	Diameter (mm)
SSDC 4000	4 Flutes	Right-hand Helix I89	ø6 to ø12
SSDC 4000RL	4 Flutes	Right/Left-hand Helix I89	ø6 to ø12

■ Features and Applications

- Two different types of flute shapes are available.

SSDC Type (Right-hand Helix Type)

Achieving both better sharpness and longer tool life through optimizing the rake and relief angles, along with a small helix angle.

SSDCRL Type (Right/Left-hand Helix Type)

Right-hand helix prevents delamination on top and bottom surfaces.
Cutting force is dispersed even with unstable clamping, improving surface quality.

■ Performance

- Surface Finish Comparison

Tool Diameter:	ø10 (4 Flutes)
Cutting Conditions:	v_c = 1,030 SFM
	(n = 10,000 RPM)
	v_f = 39.37”
	(f_z = 0.001” IPT))
	Dry

Results

SSDC Type

High surface quality with no burrs

Competitor’s Product

Burrs are formed. Low surface quality

SSEH Type Series

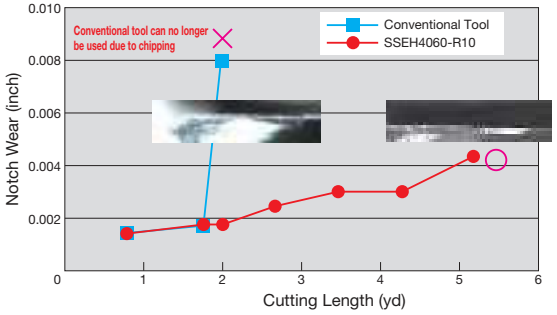
SSEH Type Radius

■ Features and Applications

- Steep helix (45° helix) improves sharpness
- Combination of unique flute design and semi-mirrored rake face improves chip evacuation and adhesion resistance.
- Ultra-smooth coating with improved hardness and thermal resistance combined with tough carbide substrate improves tool life when working with heat-resistant alloys.
- Unique, smooth radius shape mitigates cutting impact and improves fracture resistance.
- Both coated and uncoated types are in stock to meet various conditions.

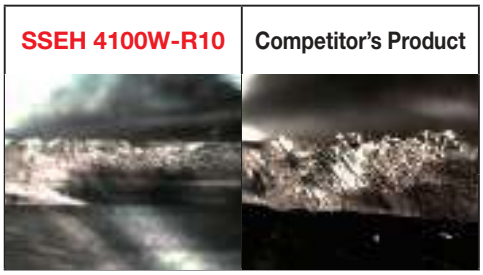
■ Application Examples

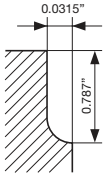
- Inconel 718 (Side Milling)



Tool Diameter: ø6 × R1
Cutting Conditions: v_c = 66 SFM, f_z = 0.001" IPT,
a_p = 0.197", a_e = 0.0197" Wet

- Inconel 713 (Side Milling)



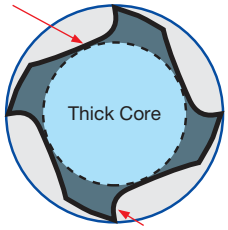


In Sumitomo Electric Hardmetal tests, the special coating with excellent adhesion resistance provided less cutting edge adhesion than the competitor's product and enabled fracture-free machining. The competitor's product suffered from edge adhesion leading to breakage.

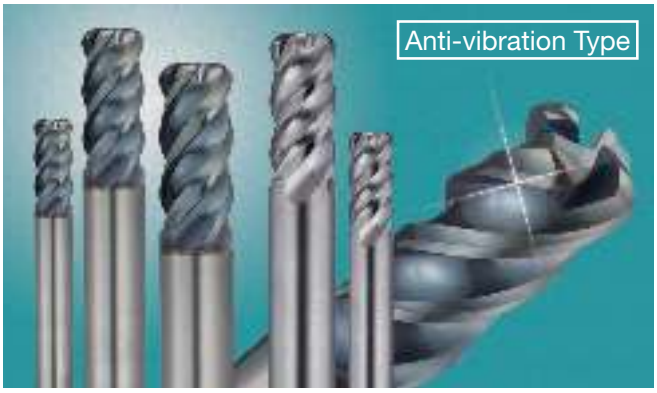
Tool Diameter: ø10 × R1 Number of Workpieces: 150pcs/unit
Cutting Conditions: v_c = 105 SFM, f_z = 0.0007" IPT,
a_p = 0.787", a_e = 0.0315" Dry

Unique, smooth radius design

Original wide arc flute



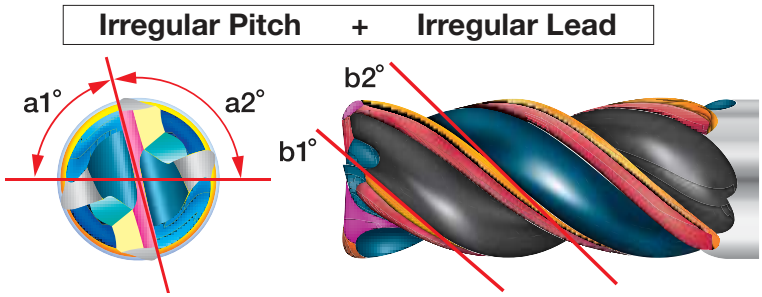
Semi-mirrored Rake Face



SSEH Radius Anti-vibration Type

■ Features and Applications

- New anti-vibration type added to the SSEH type endmill for exotic alloys.
- Builds on the same features of existing endmills by adding an irregular lead for exceptional anti-vibration performance.
- Compatible with a wide range of milling for exotic alloys including Stainless Steel, Inconel and titanium.
- Reduces chattering for high-speed, high-feed cutting.
- Both coated and uncoated types are in stock to meet various conditions.



■ Application Examples

- Corner Finishing for Titanium Alloy

	SSEH Radius Anti-Vibration Endmill SSEHVL 4120W-30	No Anti-Vibration Mechanism Endmill ø12 × R3.0
Machined Surface		
Vibration Data		Tool Breakage		

Cutting Conditions: v_c = 139 SFM (n = 1,125 RPM)
v_f = 7.87" IPM (f_z = 0.0017" IPT)
a_p = 0.197", a_e = 0.472" Wet

AURORA Coat Endmills

■ Features and Applications

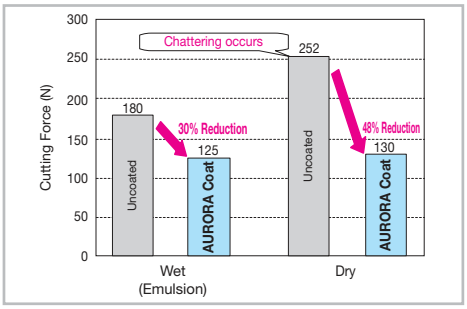
- Very smooth AURORA Coat results in low adhesion as well as a good surface finish
- With lower cutting forces and high rigidity, this series is suitable for low rigidity machines
- Available in 2- and 4-flute square type as well as ballnose type endmills
- Added R0.05 to R2.00mm long neck ballnose endmills for machining copper electrodes

■ Product Range

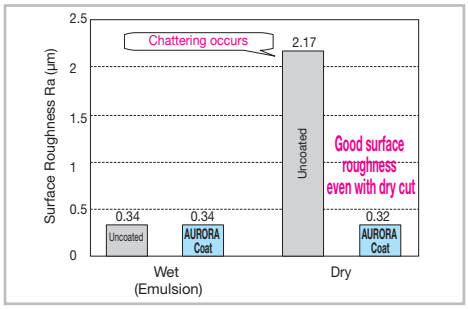
Cat. No.	No. of Teeth	Shape	Diameter (mm)
ASM 2000DL	2 Flutes	Square  I82	ø2 to ø16
ASM 4000DL	4 Flutes	Square  I83	ø2 to ø16
SNB 2000DL	2 Flutes	Ballnose  I115	R1 to R8 (ø2 to ø16)
SNB2	2 Flutes	Long Neck Ballnose  I116	R0.05 to R2 (ø0.1 to ø4)

■ Performance

● Comparison of Cutting Force



● Surface Roughness Comparison

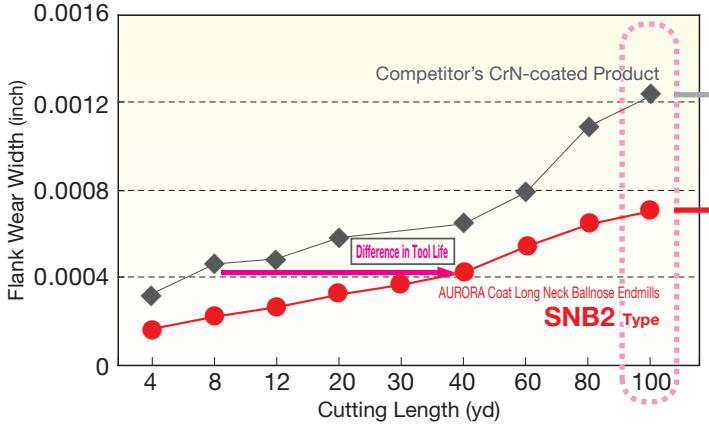


Work Material: A5052
Tool: ASM4100DL
ø10 (4 Flutes)
Cutting Conditions:
v_c = 656 SFM
n = 6,300 RPM
f_z = 0.002" IPT
v_f = 51.2" IPM
a_p = 0.40"
a_e = 0.04"
Down-cut

■ AURORA Coat Long Neck Ballnose Endmill SNB 2 Type

- Achieves longer tool life compared with chromium nitride (CrN)-coated carbide tools
- Products with ballnose radii of 0.05 to 2.00mm
- Reduced coefficient of friction
- Extremely smooth coating structure

● Tool Wear Comparison



Tool	Cutting Length 100m	Cutting Conditions
Competitor's CrN-coated Product	 Large amount of wear	Work Material: Tough-Pitch Copper Tool: R0.3mm Ballnose Endmill Cutting Conditions: v_c = 187 SFM n = 30,000 RPM a_p = 0.0014" a_e = 0.0012" Oil Mist
SNB2 Type		

Excellent adhesion resistance in copper alloy milling with long tool life!

SUMIDIA Binderless Ballnose Endmills

NPDBS Type/NPDB Type

I112, I113

Ball-nose R

For Finishing of Cemented Carbide and Hard Brittle Material

- Adopts nano-polycrystalline diamond for the cutting edge, with higher hardness than single-crystal diamond
- This enables direct engraving of cemented carbide, which is impossible for existing single-crystal or polycrystalline diamonds
- Ideal for finishing hard brittle materials, including cemented carbide. Provides high-precision machining and long tool life
- Standard finish NPDBS type dramatically reduces machining cost
- Precision finish NPDB type is polish-less to prevent shape deformation

SUMIDIA Coat Ballnose Endmills

SDCB Type

I114

Ball-nose R

For Rough/Medium Finishing of Cemented Carbide and Hard Brittle Materials

- Provides high efficiency rough/medium finishing of carbide molds
- Newly developed diamond coating exhibits stable tool life
- PCD - SUMIDIA Binderless Endmill combination provides the highest-level machining precision

CBN - SUMIBORON Radius Endmills

BNBR Type

Radius r

For Hardened Steel

CBN - SUMIBORON Ballnose Endmills

BNBP Type

Ball-nose R

For Hardened Steel

- Achieves longer tool life in high-speed, high-precision machining from pre-hardened steel to high-hardness steel in excess of 60HRC
- Excellent machined surface quality drastically reduces the grinding process
- Cutting edge design suited to profiling and face milling, plus an extensive selection of grades allows a wide range of machining applications

CBN -SUMIBORON Ballnose Endmills

BNBC Type

Ball-nose R

For Copper Electrodes

- Ballnose radii of R0.1mm to R0.5mm are covered by this series
- Adoption of grade with high CBN content provides excellent edge-sharpness performance and wear resistance
- Achieves high quality milling with high precision cutting edge

SUMIDIA Binderless Ballnose Endmills
NPDBS Type/NPDB Type

Hard Brittle Material

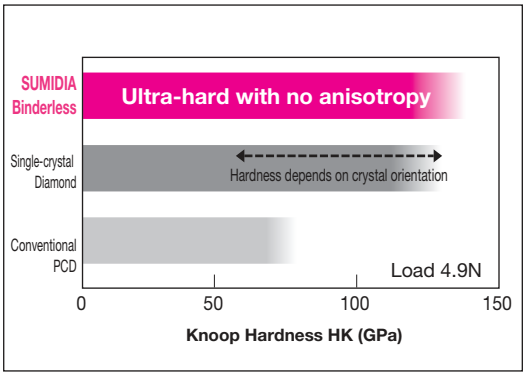
■ General Features

SUMIDIA Binderless is polycrystalline diamond that directly binds nano-order diamond particles with high strength without using any binders. Harder than single-crystal diamond, it has no cleavability, enabling machining of hard brittle material such as cemented carbide and making new machining methods possible.

■ Features

- SUMIDIA Binderless is a pure diamond material, but unlike single-crystal diamonds, it has no anisotropy. It therefore displays excellent wear resistance with less uneven wear.
- Thanks to its polycrystalline structure, SUMIDIA Binderless does not have the cleavability peculiar to single-crystal diamonds and displays excellent fracture resistance.

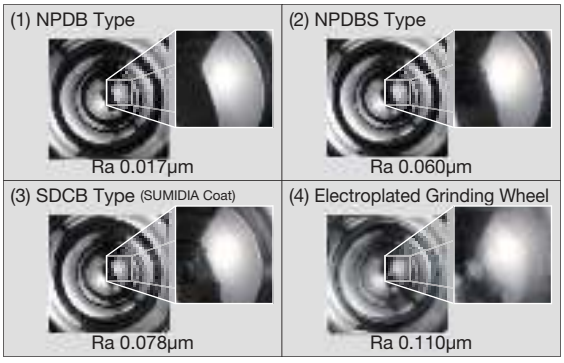
■ Hardness



● Pocketing

Part Material:	Cemented Carbide AF1 (Ultra-Fine Grained Carbide)
Machining Details:	0.40" × 0.40" × depth 0.08"
Tool:	NPDRS 1100R005-030
Cutting Conditions:	n = 40,000 RPM, v_f = 7.87" IPM p_f = 0.0002", Oil Mist
Surface Roughness:	Ra 0.015μm
Cutting Time:	2 Hours

● Hemispherical Surface Milling



Part Material:	Cemented Carbide AF1 (Ultra-Fine Grained Carbide)
Machining Details:	ø6 (Hemispherical Surface Milling)
Tool:	(1) NPDB 1050-020 (2) NPDBS 1050-020 (3) SDCB 2R050-020 (4) R0.5, #400
Cutting Conditions:	n = 40,000 RPM, v_f = 4.72" IPM p_f = 0.0002", Oil Mist
Cutting Time:	1 Hour 30 Minutes

● Application to Medical Use (μ-TAS Mold)

Part Material:	Cemented Carbide AF1 (Ultra-Fine Grained Carbide)
Tool:	NPDB 1030-010 (*R*0.3)
Cutting Conditions:	n = 38,000 RPM, v_f = 3.74" IPM p_f = 0.00004", Wet (Oil-based)
Machining Allowance:	0.00012"
Surface Roughness:	Ra 0.016 to 0.020μm
Cutting Distance:	9 yds
Cutting Time:	Finishing 1 Hour 28 Minutes

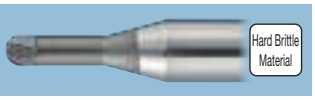
● Application to Optical Use (Fly-Eye Lens Mold)

Part Material:	Cemented Carbide AF1 (Ultra-Fine Grained Carbide)
Tool:	Finishing NPDB 1050-020 (*R*0.5) Roughing Diamond Coated Endmill (*R*0.5)
Cutting Conditions:	n = 60,000 RPM, v_f = 11.8" IPM p_f = 0.0002", Oil Mist
Surface Roughness:	Ra 0.015μm
Cutting Time:	Finishing 2 Hour 40 Minutes Roughing 55 Minutes

MOLD FINISH MASTER

Ball-nose R

SUMIDIA Coat Ballnose Endmills SDCB Type

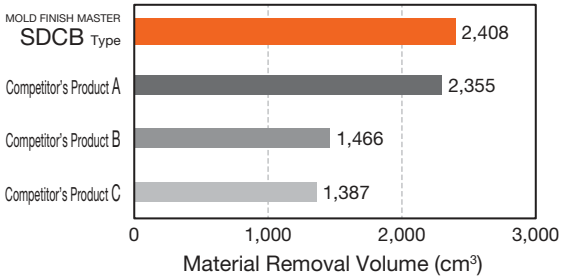


- Produces high efficiency roughing/medium finishing of carbide molds
- Newly developed diamond coating exhibits stable tool life
- SUMIDIA Binderless Endmill combination provides the highest-level machining precision

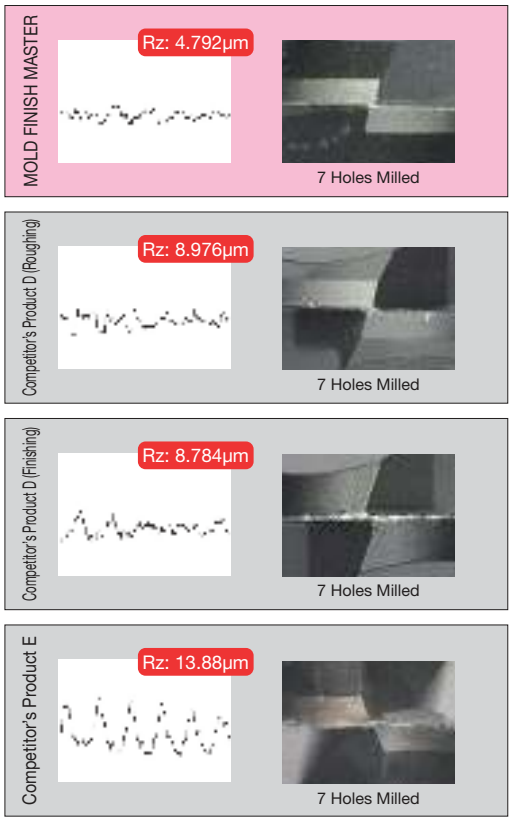
- ø10mm hemispherical machining

Part Material:	Cemented Carbide AF1 (Ultra-Fine Grained Carbide)
Tool:	SDCB 2R100-060
Cutting Conditions:	n = 30,000 RPM, v_f = 11.8" IPM
	a_e = 0.012", a_p = 0.004", Air Blow

Tool Life



- ø2.0 (R1.0) number of workpieces and tool damage (Delamination)

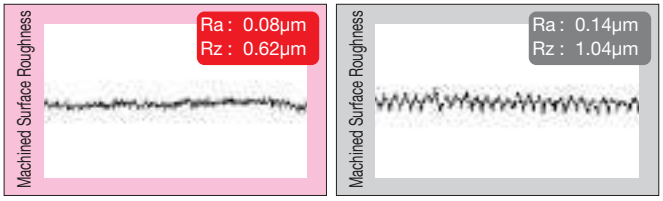


Radius r

SUMIBORON Mold Finish Master BNBR Type

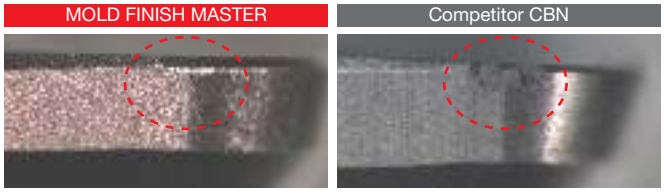
- Improved machined surface quality through use of a wiper edge (available on ø1.0mm drills and larger).

Machined Surface Comparison



With Wiper Edge | Without Wiper Edge

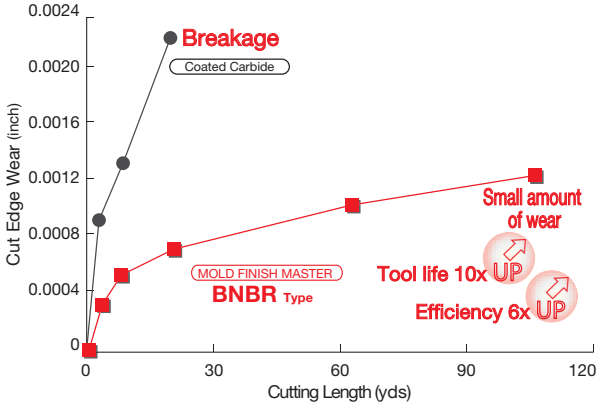
- Combination of CBN SUMIBORON BNX20 with excellent wear resistance and optimal cutting edge design provides longer tool life.



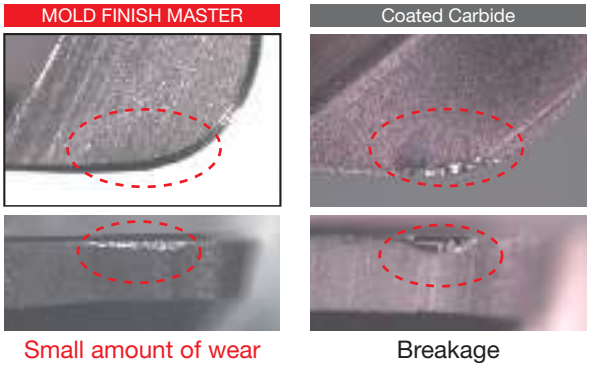
Small amount of wear | Breakage

Part Material:	STAVAX(52HRC)
Tool:	BNBR 2D200R050-0604 (ø2 × r 0.5)
Cutting Conditions:	n = 20,000 RPM, v_f = 15.75" IPM
	a_p = 0.0012", p_f = 0.0276" Oil Mist

- Excellent wear resistance delivers almost 10 times longer tool life than carbide endmills.



Tool Wear Comparison



Small amount of wear | Breakage

Work Material: STAVAX(52HRC)
Tool: BNBR 2D200R050-0604 (ø2 × r 0.5)

MOLD FINISH MASTER
Cutting Conditions: n = 20,000 RPM, v_f = 31.5" IPM

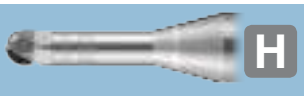
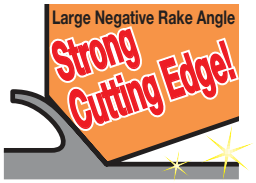
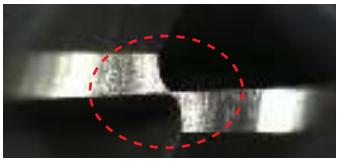
Coated Carbide
Cutting Conditions: n = 4,800 RPM, v_f = 4.72" IPM
a_p = 0.0012", p_f = 0.0276" Oil Mist

SUMIBORON Mold Finish Master BNBP Type



- Achieves high precision machining with precise ball radius of ±0.005mm.
- Combination of SUMIBORON BN350 with excellent fracture resistance and cutting edge designed with negative rake angle provides stable, interrupted cutting.





Central edge stabilizes machined surface quality

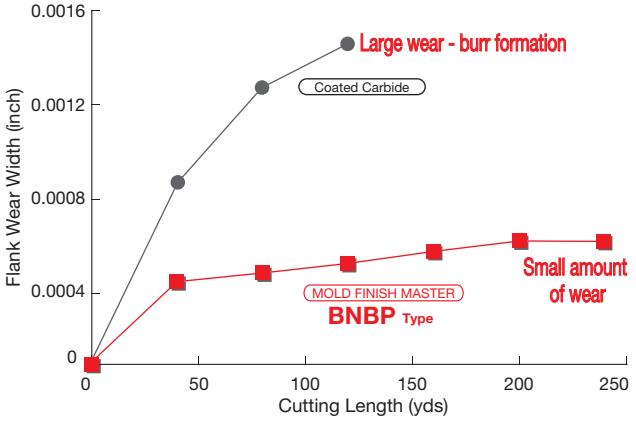
- Strong cutting edge enables use in roughing applications

MOLD FINISH MASTER | Coated Carbide

No fracture | Breakage on central edge

Work Material:	STAVAX(52HRC)
Tool:	BNBP 2R100-0554 (*R*1.0)
Cutting Conditions:	n = 25,000 RPM, v_f = 59" IPM
	a_p = 0.004", p_f = 0.008" Oil Mist

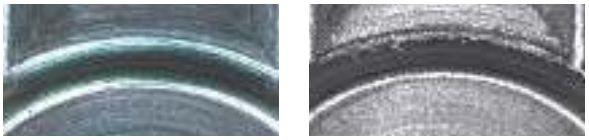
- Excellent wear resistance and machined surface quality



Tool Wear Comparison

MOLD FINISH MASTER (6 passes) | Coated Carbide (2 passes)

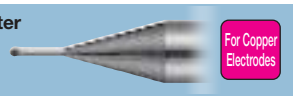
Small amount of wear | Large amount of wear



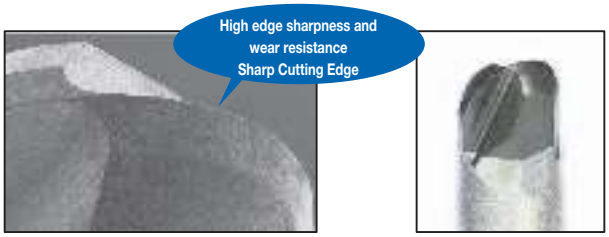
Good machined surface | Burr formation

Work Material:	STAVAX(52HRC)
Tool:	BNBP 2R030-0154 (*R*0.3)
Cutting Conditions:	n = 25,000 RPM, v_f = 59" IPM
	a_p = 0.002", p_f = 0.004" Oil Mist

SUMIBORON Mold Finish Master BNBC Type

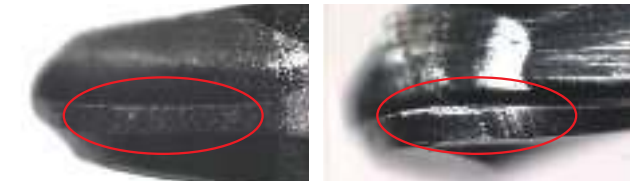


- Ballnose radii of 0.1 to 0.5mm are covered by this series.
- Achieves high quality milling with high precision cutting edge.



- Achieves further improved tool life

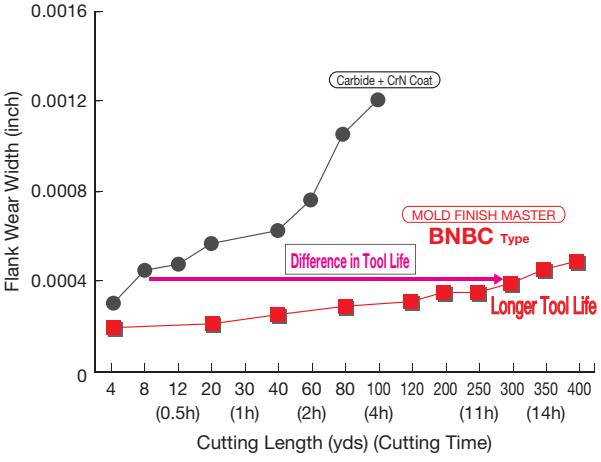
MOLD FINISH MASTER | Competitor's Carbide + CrN-Coated Product



Low Wear (Cutting Length 15.75") | High Wear (Cutting Length 3.94")

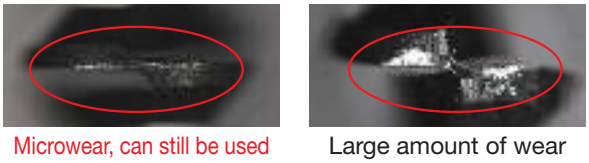
Work Material:	Tough-Pitch Copper (Side Milling)
Tool:	BNBC 2R030-0304 (*R*0.3)
Cutting Conditions:	n = 30,000 RPM, v_f = 27.56" IPM
	a_p = 0.014", a_e = 0.0012" Oil Mist

- Adoption of material with high CBN content provides excellent edge-sharpness performance and wear resistance.

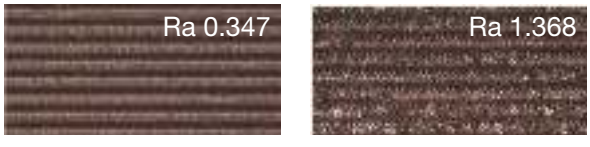


Tool Wear Comparison

MOLD FINISH MASTER | Competitor's Carbide + CrN-Coated Product



Microwear, can still be used | Large amount of wear



Good cutter mark surface on BNBC Type

Work Material:	Tough-Pitch Copper
Tool:	BNBC 2R030-0304 (*R*0.3)
Cutting Conditions:	v_c = 187 SFM, n = 30,000 RPM
	f_z = 0.0003" IPT, v_f = 15.75" IPM
	a_p = 0.0002", a_e = 0.002" Oil Mist

Recommended Cutting Conditions

1. If cutting noise and vibration occur, please reduce the cutting conditions accordingly.
2. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
5. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

C: Gash Land

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. In some cases, chattering may occur in early stages of milling but will cease after 2m of cutting.
5. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Endmill Identification (GSXMILL Series Only)

GSX 2 04 S - 3D

Series Code | Number of Flutes | Diameter in 64ths (4/64 = 0.0625") | Cutting Edge | Cutting Edge Length

S: Sharp Edge

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
5. This series is not recommended for groove milling.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Endmill Identification (GSXMILL Series Only)

GSX 4 04 C - 2D

- GSX: Series Code
- 4: Number of Flutes
- 04: Diameter in 64ths (4/64 = 0.0625")
- C: Cutting Edge (C: Gash Land)
- 2D: Cutting Edge Length

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. In some cases, chattering may occur in early stages of milling but will cease after 2m of cutting.
5. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Endmill Identification (GSXMILL Series Only)

GSX 4 04 C - 4D

Series Code | Number of Flutes | Diameter in 64ths (4/64 = 0.0625") | Cutting Edge: C: Gash Land | Cutting Edge Length

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. In some cases, chattering may occur in early stages of milling but will cease after 2m of cutting.
5. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Endmill Identification (GSXMILL Series Only)

GSX 4 04 S - 3D

Series Code | Number of Flutes | Diameter in 64ths (4/64 = 0.0625") | Cutting Edge | Cutting Edge Length

S: Sharp Edge

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Endmill Identification (GSXMILL Series Only)

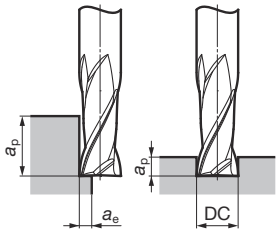
GSX 2 0150 S - 2D - S3

Series Code	Number of Teeth	Dia.	Cutting Edge (S: Sharp Edge)	Cutting Edge Length	Shank Dia.

GSX 20000S-2D Type



Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
5. This series is not recommended for groove milling.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Side Milling

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. In some cases, chattering may occur in early stages of milling but will cease after 2m of cutting.
5. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Endmill Identification (GSXMILL Series Only)

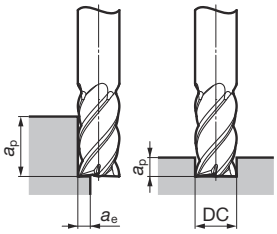
GSX 4 0100 S - 2D - S3

Series Code	Number of Teeth	Dia.	Cutting Edge S: Sharp Edge	Cutting Edge Length	Shank Dia.

GSX 40000S-2D Type



Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
5. This series is not recommended for groove milling.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

GSX 40000S-3D Type

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. In some cases, chattering may occur in early stages of milling but will cease after 2m of cutting.
5. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. In some cases, chattering may occur in early stages of milling but will cease after 2m of cutting.
5. If chatter is a problem, reduce the spindle speed and feed rate indicated in the table below by the same ratio, or reduce the depth of cut.
6. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Recommended Cutting Conditions

1. Use dry cutting (air blow) conditions.
2. Down cut is recommended.
3. Make overhang as short as possible and use a rigid machine.

Recommended Cutting Conditions

1. The cutting conditions are guidelines.
   Cutting conditions are greatly influenced by clamping, work material grade, work material thickness and machine rigidity. Adjust the conditions accordingly.
2. Take sufficient dust control measures.
3. When radial depth of cut is 0.7D or more in groove milling and trimming, reduce feed rate accordingly.

Identification Code

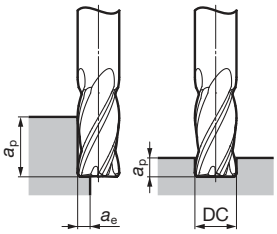
GSV 4 030 - R 02 - 2.5D

- GSV — Series Code
- 4 — Number of Teeth
- 030 — Dia.
- R — Cutting Edge (R: Radius)
- 02 — Nose Radius
- 2.5D — Cutting Edge Length

GSV 4000-R-2.5D Type



Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Recommended Cutting Conditions

1. For stable machining, a high-rigidity machine is recommended.
2. Wet machining is recommended for stainless steel and heat-resistant alloy applications.
3. If cutting noise and vibration are present, please change the cutting conditions accordingly.

Recommended Cutting Conditions

1. Use a precision machine for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant. Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions as necessary as equipment performance and other conditions may vary.
5. Values shown in the table of conditions are guidelines. Adjust the actual cutting conditions to the desired machined surface quality.

Recommended Cutting Conditions

1. Use a machine with high rigidity for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant.
   Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions as necessary as machine rigidity and other conditions may vary.
5. Depths of cut shown in the table of conditions are maximum depths. Adjust the actual depth of cut to the desired machined surface roughness.

Recommended Cutting Conditions

1. If cutting noise and vibration occur, please reduce the cutting conditions accordingly.
2. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

Grade: DL1200

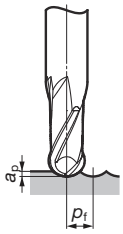
SNB2 Type



Recommended Cutting Conditions

1. For radius processing, reduce the feed to half the recommended feed.
2. Non-water soluble cutting oil is recommended.
3. Because of the high spindle speeds, runout of the endmill when mounted should be less than 10 µm.

Recommended Cutting Conditions

1. Use a precision machine for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant.
   Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions as necessary as equipment performance and other conditions may vary.
5. Values shown in the table of conditions are guidelines. Adjust the actual cutting conditions to the desired machined surface quality.

BNBP Type

Recommended Cutting Conditions

1. Use a machine with high rigidity for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant.
   Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions according to actual conditions as machine rigidity and other conditions may vary.
5. Depths of cut shown in the table of conditions are maximum depths. Adjust the actual depth of cut to the desired machined surface roughness.

Recommended Cutting Conditions

1. Use a machine with high rigidity for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant.
   Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions according to actual conditions as machine rigidity and other conditions may vary.
5. Depths of cut shown in the table of conditions are maximum depths. Adjust the actual depth of cut to the desired machined surface roughness.

Grade: BN350

Recommended Cutting Conditions

1. Use a rigid machine and select a high cutting speed with a low feed rate.
2. Use dry cutting conditions.
3. Make overhang as short as possible.
4. If the work material hardness is lower than 50HRC, try the GS MILL Hard Ballnose instead (→ I132).

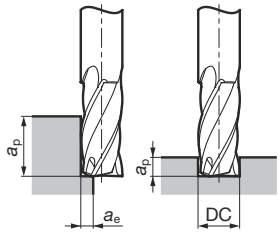
Series Code	Number of Teeth	Dia.	Cutting Edge	Cutting Edge Length
			C: Gash Land	

GSXSLT 30000C-1.5D Type



Recommended Cutting Conditions

1. For stable machining performance use rigid, high-precision machines and holders.
2. Use air blow when dry machining.
3. Use wet machining for stainless steel, heat-resistant alloy, and titanium alloy applications.
4. Use step machining of 0.1 DC when drilling stainless steel, heat-resistant alloy, and titanium alloy.
5. If the machine cannot achieve the recommended spindle speed, please use the maximum spindle speed available.

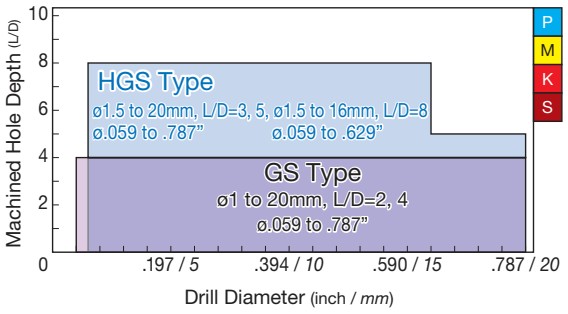
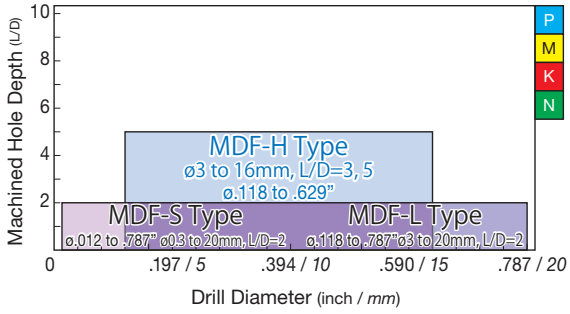
Application Range of Sumitomo Drills

Coolant: External supply / Internal supply

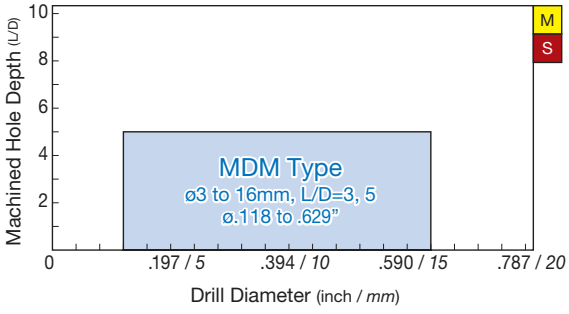
GS/HGS for General-Purpose High Efficiency Drilling J8



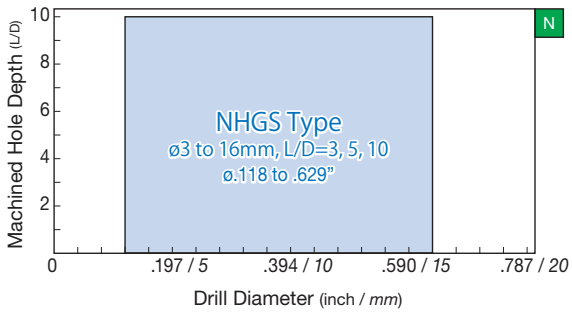
MDF Flat Bottom Drilling J44



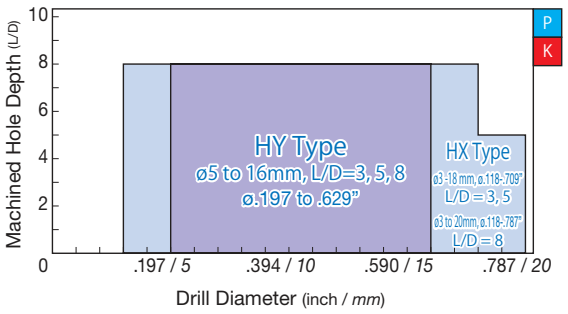
MDM for Stainless Steel & Exotic Alloy Cutting J36



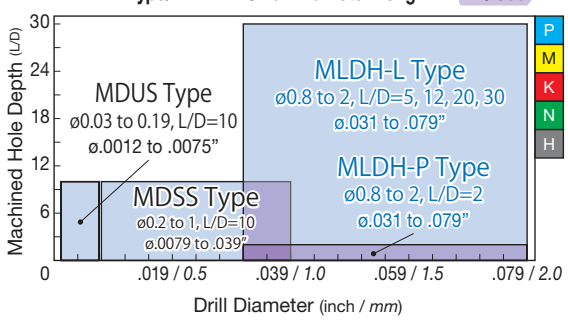
NHGS for High-efficiency Drilling of Aluminum Alloy J77



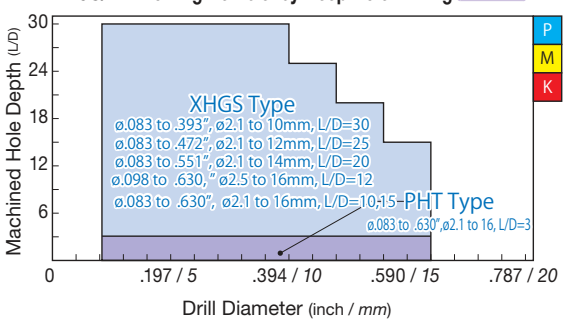
HX: for Cast Iron J58
HY: for High-efficiency Steel and Cast Iron J65



MDUS Type/MDSS Very Small Diameter Drills J88
MLDH-L Type/MLDH-P Small Diameter Long Drill J85

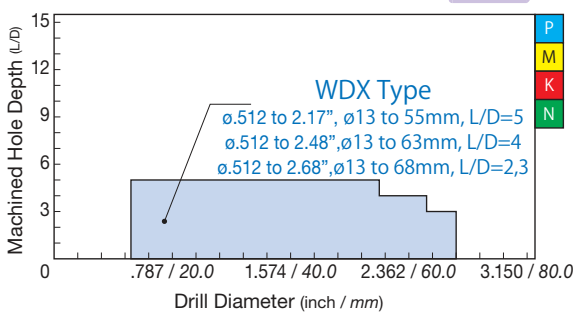


XHGS/PHT for High-efficiency Deep Hole Drilling J69



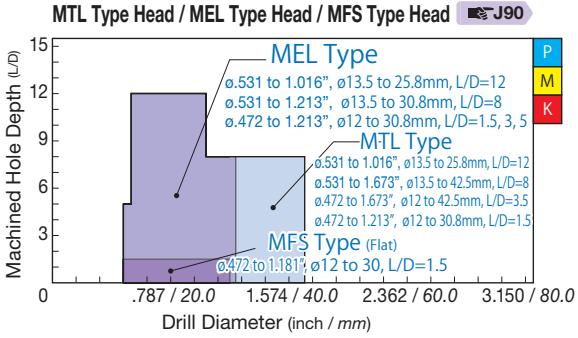
■ Indexable Insert Type Drill

WDX Indexable Drills J106



■ Indexable Tip Drills

SMD Replaceable Tip Drills
MTL Type Head / MEL Type Head / MFS Type Head J90



Drill Coating

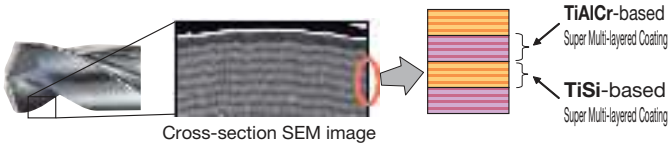
DEX Coating

■ General Features

Sumitomo's next-generation drill coating utilizes nano-coating technology to provide more than **double the tool life** of conventional coatings.

■ Features

- Coating Design
  World's first combined super multi-layered coating made from alternate layers of two super multi-layered substrates.



Cross-section SEM image

- Silicon and chrome improve wear, thermal and adhesion resistance.
- Super multi-layered structure offers improved chipping resistance.

■ DEX Coating Application Examples

GS Type MultiDrill with DEX Coating (after machining 100 holes)	
Competitor's product A (after machining 70 holes)	

Tool: MDW0800GS4
Part Material: Carbon Steel (200HB)
Cutting Conditions: v_c=230 SFM, f=0.0098 IPR, H=1.260", external coolant supply (water soluble)

DLC Coating (AURORA)

DL1300 DL1500

■ General Features

DLC Coating - AURORA is a high-hardness, low-friction coefficient layer of DLC (Diamond-like Carbon) which dramatically improves adhesion resistance in drilling of aluminum alloy and non-ferrous metals, and works with combinations of special shapes to achieve stable long tool life.

■ Features

- Thin, ultra-smooth DLC coating with a low coefficient of friction
  Helps prevent adhesion to the cutting edge and requires significantly less cutting force during drilling of aluminum alloy and non-ferrous metals.
- High adhesion strength withstands stringent cutting conditions
  The world's first coating applicable to cutting tools, with a special coating technique that significantly improves adhesion strength.
- A spectrum of colors
  Glossy colours are achieved by the special coating technique.

■ DLC Coating - AURORA Application Examples

AURORA Coating Super MultiDrill NHGS Type (after drilling 100 holes)	 Clean cutting edge with no adhesion
Competitor's Product B (after drilling 20 holes)	 Severe adhesion

Tool: MDW0800NHGS5
Part Material: Aluminum Alloy
Cutting Conditions: v_c= 650 SFM, f= .0394 IPR, H=1.260", internal coolant supply

Diamond Coating - SUMIDIA®

■ General Features

Our original polycrystalline diamond coating technology achieves over 10 times the wear resistance of uncoated carbide.
Excellent diamond film adhesion is achieved with a combination of a dedicated diamond coating alloy and a proprietary coating pre-treatment technique.

■ Features

- Micro-grain diamond coating that provides the combination of high strength and high wear resistance on smooth surfaces that is required for CFRP drilling

■ Diamond Coating - SUMIDIA® Application Examples

SUMIDIA Coat	Competitor's Diamond Coating
	
No. of Workpieces: 600 holes Able to continue 	No. of Workpieces: 50 holes Coating peels and burrs are formed 

Tool: Diamond Coating SUMIDIA® Drill ø6.35mm
Part Material: CFRP
Cutting Conditions: v_c=430 SFM, f=0.003 IPR, H=.590", through hole, dry

■ General Features

The GS and HGS styles (Super MultiDrill) are solid carbide drills that employ a new flute design and wide chip pocket to achieve excellent chip control and evacuation.
DEX coating enables long, stable tool life over a wide cutting range, with various work materials and applications.

DEX Coating

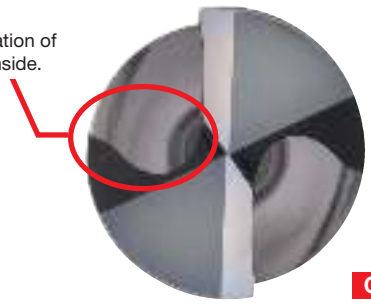
■ Features and Applications

- Long tool life
  New cutting edge design and special DEX Coating provide long tool life for a wide variety of work materials.
- Stable chip evacuation
  New flute shape significantly improves chip control and evacuation.
- Quiet cutting and stable cutting force
  Stable drilling with little wobble even in small machine applications.
- Environmentally friendly
  Also compatible with the MQL (Minimum Quantity Lubrication) system.

Jflute
*"J flute" is a registered trademark.

HGS

Wide chip pocket for smooth evacuation of chips generated inside.



GS

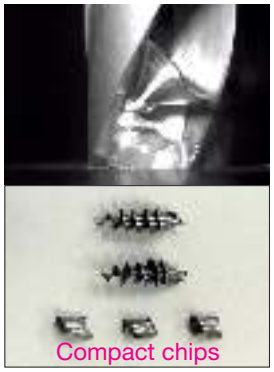
■ Product Range

Coolant Supply	Cat. No.	Diameter Range (inch)	Hole Depth (L/D)
External (GS)	MDW□□□□GS2	ø.0394 to ø.7874	up to 2
	MDW□□□□GS4		up to 4
Internal (HGS)	MDW□□□□HGS3	ø.0591 to ø.7874	up to 3
	MDW□□□□HGS5		up to 5
	MDW□□□□HGS8	ø.0591 to ø.6299	up to 8

■ Performance

Chip control

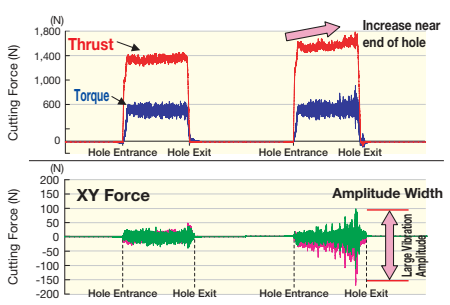
GS



Compact chips

Conventional Tool

Comparison of Cutting Force

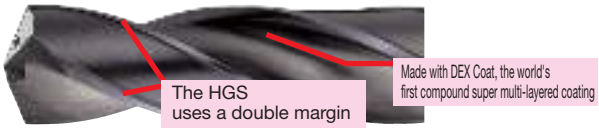


GS provides stable drill behaviour throughout the drilling process

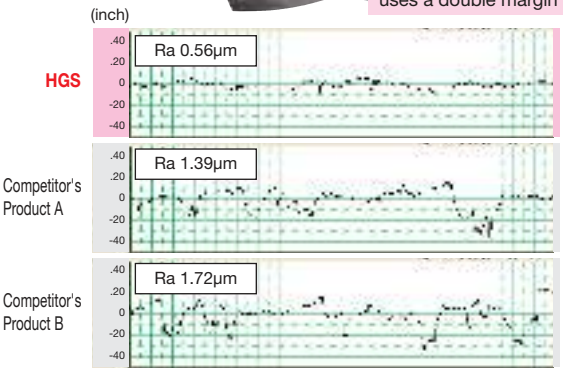
Tool: MDW0800GS4
Part Material: 1049 Steel (200HB)
Cutting Conditions: v_c=262sfm, f=.0098inch/rev, H=.9449inch,
external coolant supply (water soluble)

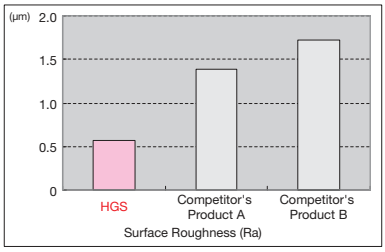
■ Uses double margin (HGS) (excluding ø.0591 to ø.0945 sizes)

The HGS uses a double margin for greater stability and hole precision in deep drilling



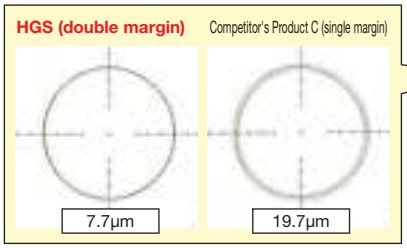
● Surface Roughness Comparison

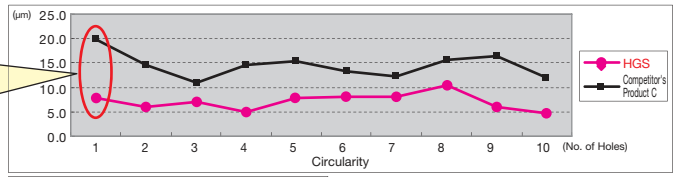




Part Material: Alloy Structural Steel (120HB)
Tool: MDW0800HGS5
Cutting Conditions: v_c=262sfm, f=.0098inch/rev, H=1.4961inch
Internal coolant supply: Water soluble

● Circularity Comparison



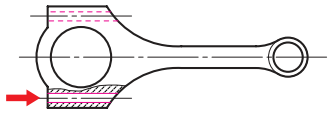


Part Material: 1049 Steel (200HB)
Tool: MDW0800HGS8
Cutting Conditions: v_c=262sfm, f=.0098inch/rev
H=2.5197inch, internal coolant supply (water soluble)

4-point guide design thanks to double margin reduces runout for improved stability.
Good surface roughness and circularity.

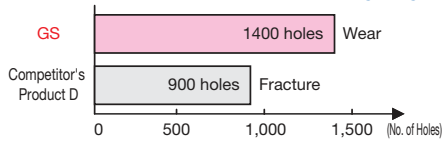
■ Application Examples for GS Drills

● Medium Carbon Steel (250HB) for Automotive

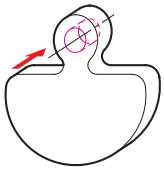


·Tool: MDW0970GS4
·Cutting Conditions: v_c=262sfm, f=.0098inch/rev
H=.9843inch, external coolant supply (water soluble)

Achieves 1.5 times the tool life!
Reduces wear on peripheral cutting edge

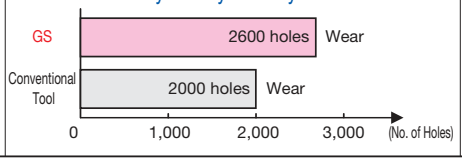


● Prehardened Mold Steel Machine Components

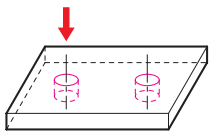


·Tool: MDW0980GS2
·Cutting Conditions: v_c=230sfm, f=.0059inch/rev
H=.2756inch, external coolant supply (water soluble)

1.3 times longer tool life than conventional tools.
Good circularity and cylindricity.

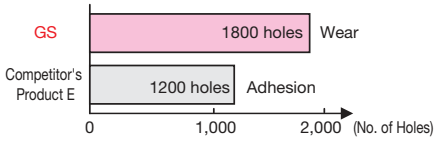


● Structural Steel Machine Components



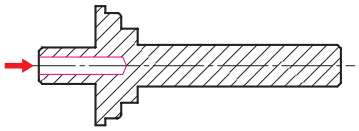
·Tool: MDW 050GS4
·Cutting Conditions: v_c=492sfm, f=.0118inch/rev
H=.4724inch, external coolant supply (water soluble)

Achieves 1.5 times the tool life!
Good chip control



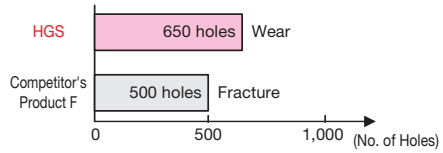
■ Application Examples for HGS Drills

● Structural Alloy Steel for Automotive

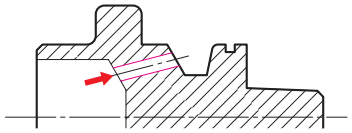


·Tool: MDW 0600HGS8
·Cutting Conditions: v_c=262sfm, f=.0098inch/rev
H=1.8898inch, internal coolant supply (oil-based)

Achieves 1.3 times the tool life!

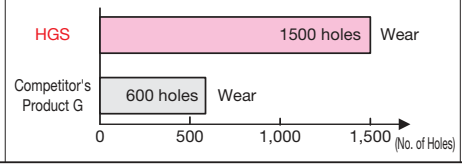


● Alloy Bearing Steel Automotive Components

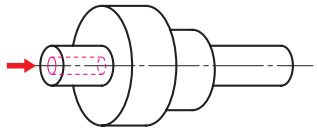


·Tool: MDW0570HGS5
·Cutting Conditions: v_c=262sfm, f=.0039inch/rev
H=1.378inch, internal coolant supply (water soluble)

Achieves 2.5 times the tool life!

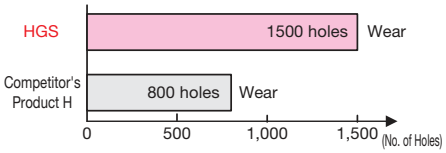


● Low Carbon Steel Machine Components



·Tool: MDW0860HGS3
·Cutting Conditions: v_c=171sfm, f=.0079inch/rev
H=.9843inch, internal coolant supply (water soluble)

Achieves 1.8 times the tool life!



Tap Size values fall between 55% and 75% of thread engagement, and should be adjusted according to application

*Refer to N74 for the tolerance of h6 and h8

Grade: ACX70

DEX Coating 2D 4D

Tap Size values fall between 55% and 75% of thread engagement, and should be adjusted according to application

*Refer to N74 for the tolerance of h6 and h8

Cut tap reccomendations based on 60-75% full thread.
Form tap reccomendations based on 55-70% full thread.
Tap Size values should be adjusted according to application.

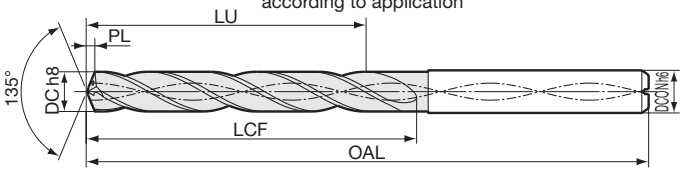
Grade: ACX70

● USA stocked item ★ Worldwide Warehouse Item

*Refer to N74 for the tolerance of h6 and h8

Fig. 2 (diameter ø2.5 to 20.0mm 0.098"-0.787", double margin)

Tap Size values fall between 55% and 75% of thread engagement, and should be adjusted according to application



Diameter *ø2.90 to 3.86mm* (0.1142" to 0.1520") Dimensions (inch/*mm*)

New

■ General Features

- Newly developed oil hole shape with excellent cooling performance achieves longer tool life.
- Effective cooling of the cutting edge created through fluid analysis.
  Reduces adhesion breakage.
- Chip control and work hardening problems resolved, all in one.
- Outstanding stability in machining of stainless steel and exotic alloys.

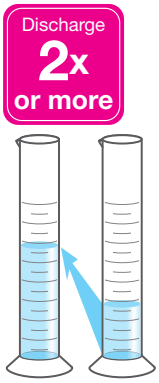
■ Features and Applications

- Greater discharge of coolant for effective cooling of the cutting edge.

Bean Jet Cooling

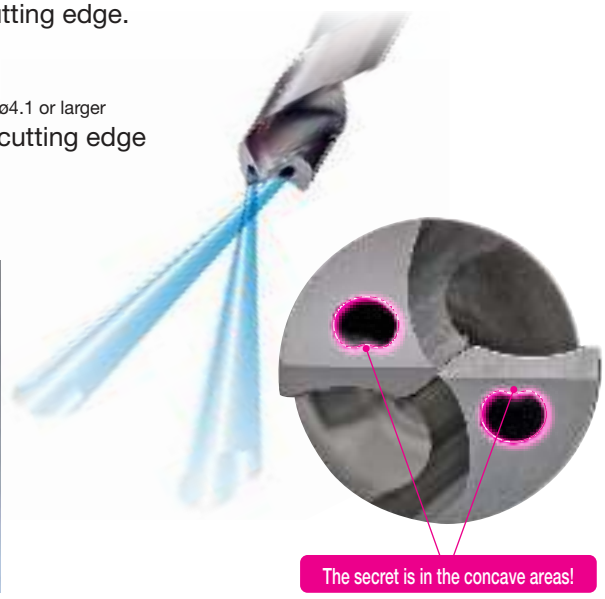
*Suitable for drill diameters of ø4.1 or larger

Newly developed bean-shaped oil hole supplies coolant on cutting edge for effective cooling of the cutting edge



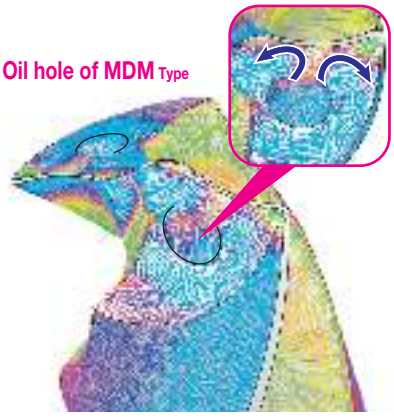
MDM Type

Conventional Tool



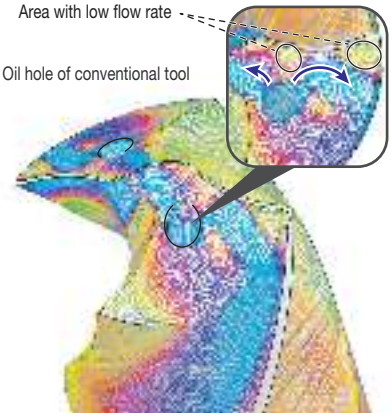
- New technology created through fluid analysis for effective cooling of the cutting edge

Oil hole of MDM Type



Area with low flow rate

Oil hole of conventional tool



Analysed at tool rotation speed of 3,200min^{-1}

Low flow rate High flow rate

- Significantly reduces adhesion on the cutting edge, preventing adhesion breakage

MDM Type

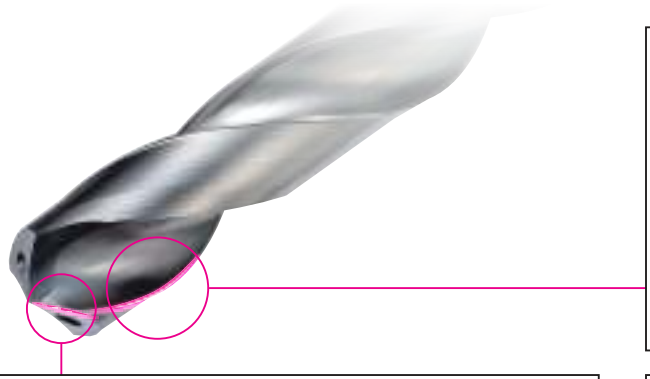
Minimal adhesion, able to continue

Competitor's Product

Adhesion breakage in outer edge

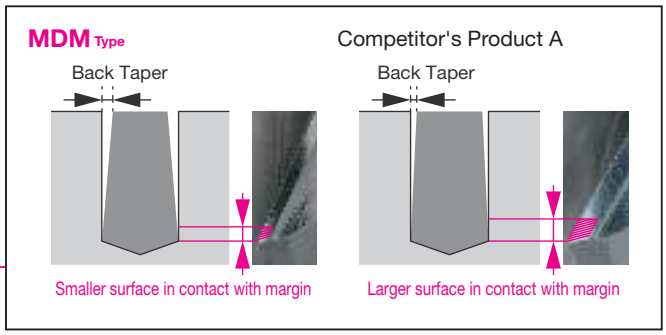
Part Material	: 304 Stainless Steel
Machine	: BT30 vertical machining center
Tool	: MDM 0800S08H05 (ø8mmx5D)
Cutting Conditions	: v_c=262 SFM, f=0.010 IPR, H=1.57" (through), internal coolant supply (water soluble)
Drilling Distance	: 131ft

● New cutting edge design that emphasises sharpness for good chip control

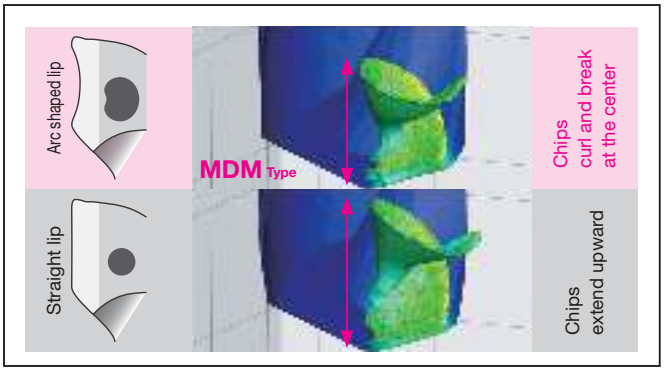


● Narrow margin and large back taper

Reducing the contact area with the workpiece, suppressing temperature rise at the margin

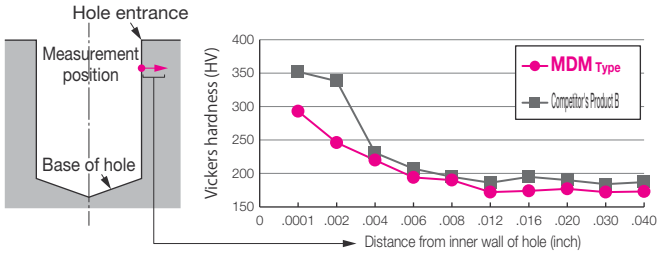


Part Material : 304 Stianless Steel
Machine : BT30 vertical machining centre
Tool : MDM 0400S04H05 (ø4.0mmx5D)
Cutting Conditions : v_c=262 SFM, f=0.004 IPR, internal coolant supply (water soluble)



● Suppressing work hardening on drilled hole wall

Reduces cutting load, reducing damage to the drill and increasing the life of the reamer and tap used in post-processing



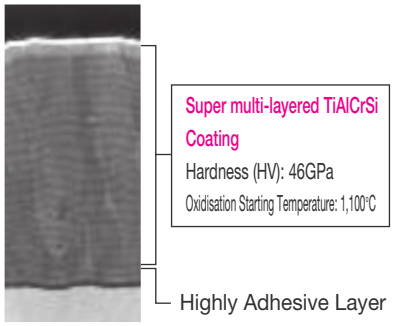
Part Material : 304 Stainless Steel
Machine : BT30 vertical machining center
Tool : MDM 0800S08H05 (ø8.0mmx5D)
Cutting Conditions : v_c=262 SFM, f=0.008 IPR, H=1.57" (through), internal coolant supply (water soluble)

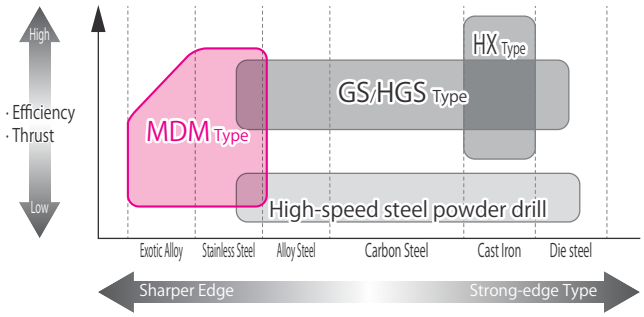
● New grades ideal for stainless steel and exotic alloy drilling

ACT70

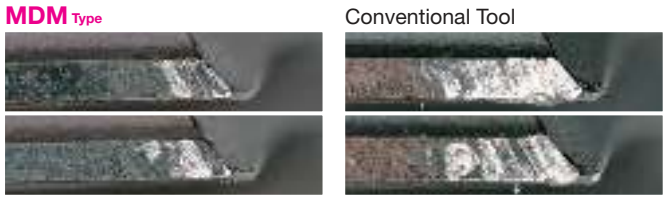
● NX Coating

Made with Absotech™ technology for high quality, high hardness, high strength and excellent wear resistance and thermal resistance.



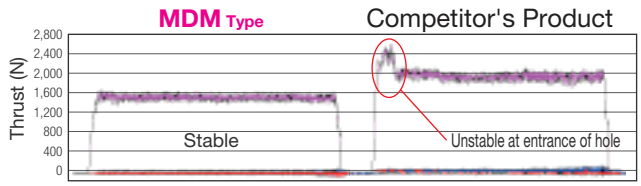


● New coating reduces margin wear



Part Material : 304 Stainless Steel, Machine: BT30 vertical machining center
Tool : MDM 0800S08H05 (ø8.0mmx5D)
Cutting Conditions : v_c=262 SFM, f=0.008 IPR, H=1.57" (through), internal coolant supply (water soluble)

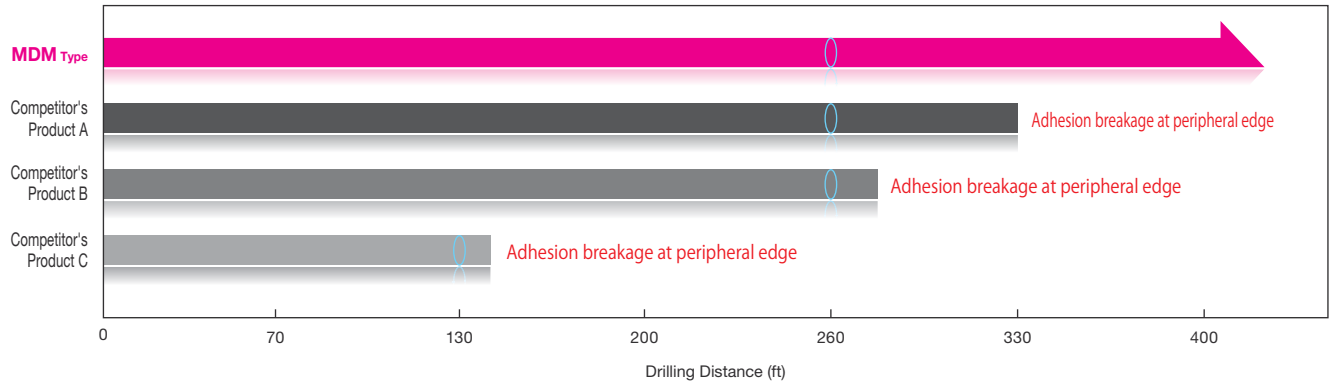
● Reduces thrust for stable drilling from the entrance to the exit of the hole



Work Material : SUS304, Machine: BT30 vertical machining centre
Tool : MDM 0800S08H05 (ø8.0mmx5D)
Cutting Conditions : v_c=262 SFM, f=0.008 IPR, H=1.57" (through), internal coolant supply (water soluble)

■ Application Examples

Austenitic Stainless Steel (Machining Center)



MDM Type after 262ft of drilling

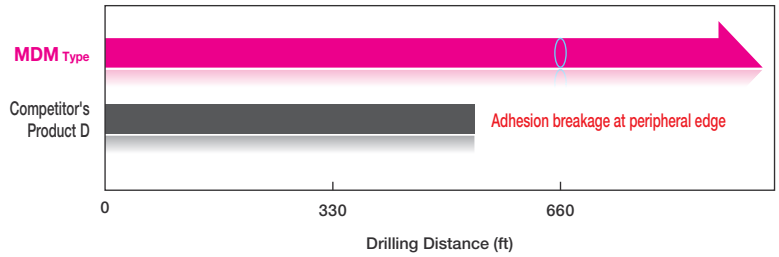
Competitor's product A after 262ft of drilling

Competitor's product B after 262ft of drilling

Competitor's product C after 131ft of drilling

Part Material: 304 Stainless Steel, Machine: BT30 vertical machining center, Tool: MDM 0800S08H05 (ø8mm×5D)
Cutting Conditions: v_c=262 SFM, f=0.008 IPR, H=1.57" (through), internal coolant supply (water soluble)

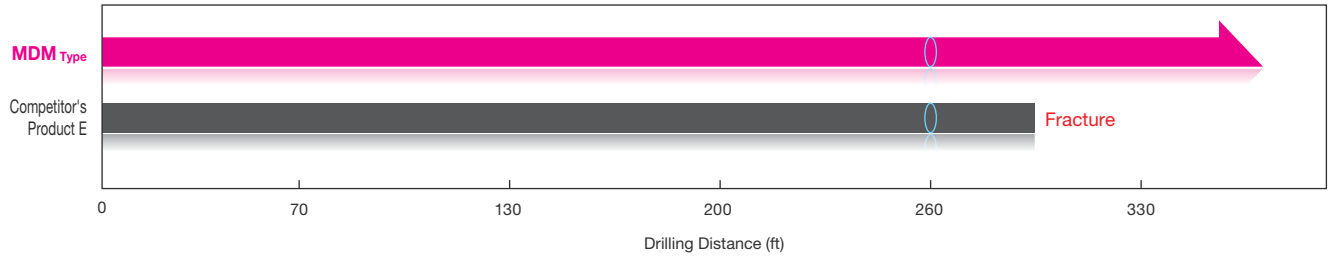
Austenitic Stainless Steel (Small Lathe)



MDM Type after 656ft of drilling

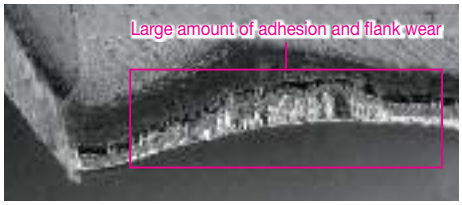
Part Material: 304 Stainless Steel, Machine: CNC autolathe (workpiece rotates), Tool: MDM 0540S06H03 (ø5.4mmx3D)
Cutting Conditions: v_c=154 SFM, f=0.0047 IPR, H=0.984" (stop), internal coolant supply (non-water soluble)

Precipitation Hardening Stainless Steel



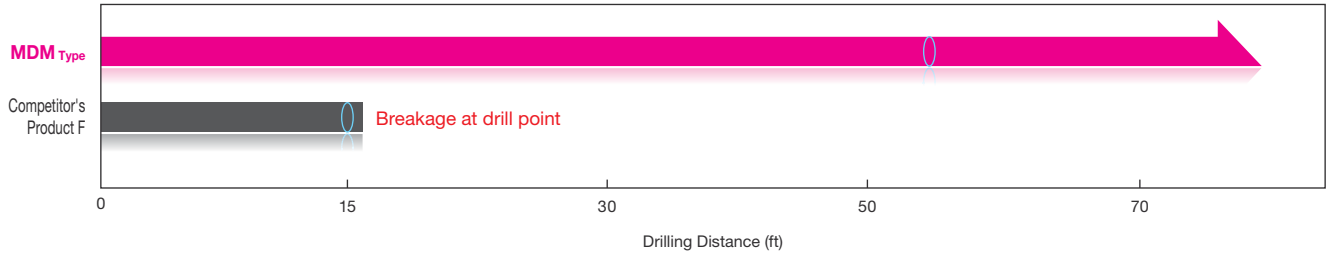
MDM Type after 262ft of drilling

Competitor's product E after 262ft of drilling



Part Material: Precipitation Hardening Stainless Steel, Machine: BT30 vertical machining center, Tool: MDM 0400S04H05 (ø4mm×5D)
Cutting Conditions: v_c=164 SFM, f=0.004 IPR, H=0.551" (stop), internal coolant supply (water soluble)

Duplex Stainless Steel

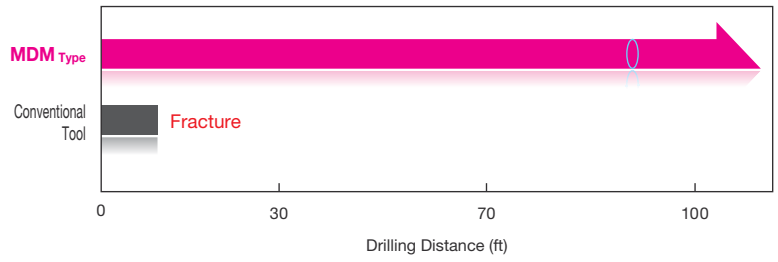


MDM Type after 52ft of drilling

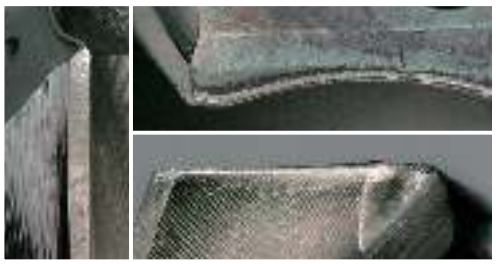
Competitor's product F after 16ft of drilling

Part Material: Austenitic-ferritic (Duplex) Stainless Steel, Machine: BT30 vertical machining center, Tool: MDM 0800S05H05 (ø8mm×5D)
Cutting Conditions: v_c=197 SFM, f=0.008 IPR, H=1.181" (through), internal coolant supply (water soluble)

Titanium Alloy



MDM Type after 89ft of drilling

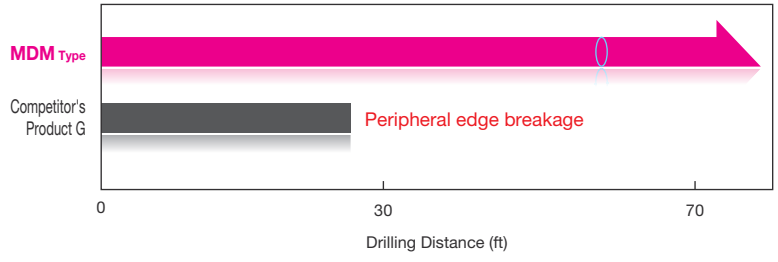


MDM Type

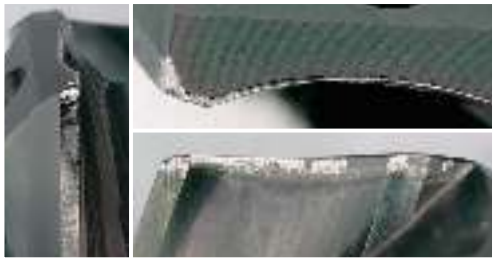
Conventional Tool

Part Material: Ti-6Al-4V, Machine: BT50 vertical machining center, Tool: MDM 0500S05H05 (ø5mm×5D)
Cutting Conditions: v_c=131 SFM, f=0.0047 IPR, H=0.748" (stop), internal coolant supply (water soluble)

Heat-resistant cast steel



MDM Type after 56ft of drilling



Part Material: SCH13X equivalent, Machine: BT50 vertical machining center, Tool: MDM 0880S09H03 (ø8.8mmx3D)
Cutting Conditions: v_c=164 SFM, f=0.0043 IPR, H=0.709" (stop), internal coolant supply (water soluble)

MDM Type (Internal Coolant Supply)

NX Coat | 3D | 5D

Recommended Cutting Conditions

1. The recommended cutting conditions below are for cases where an internal supply of a water soluble coolant is used.
2. If using non-water soluble coolant, reduce the cutting speed by 20-30% and ensure that sufficient coolant is supplied.
3. When mounting the drill in the collet, make sure that runout around the cutting edge is no greater than 0.02mm.
4. Make sure the flute does not enter the collet.
5. If the part entering the workpiece is abnormally shaped (tilted, interrupted etc.), reduce the feed rate to about half when inserting the drill in the workpiece.
   *If stable machining is still not possible, pre-machining of the flat surface with the MDF Flat MultiDrill is recommended.
6. When performing intermittent through drilling, reduce the feed rate to about half the feed rate used prior to this process.

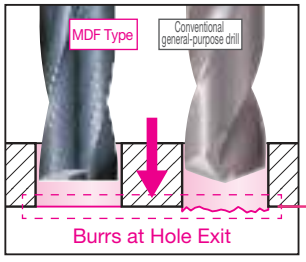
■ General Features

The flat multidrill MDF type is a solid carbide drill that can be used for various applications, including high-efficiency spot facing and drilling in inclined and curved surfaces.

■ Features and Applications

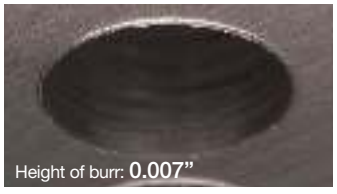
- Suited to various types of drilling thanks to a point angle of 180°
  Can be used for high-efficiency spot facing, drilling in non-horizontal surfaces such as inclined and cylindrical surfaces, and interrupted drilling. Also reduces burrs at the hole exit.
- Improves machining stability
  Achieves high rigidity by employing RS THINNING, which ensures thick web at the bottom.
- Excellent chip evacuation
  Achieves excellent chip evacuation thanks to the wide chip pocket and high-quality rake face shape.
- Excellent cutting edge strength
  Achieves excellent cutting edge strength through optimized cutting edge design.
- Long types available
  Overhang lengths up to L/D=10 can now be handled.
- Types with oil hole available
  Coolant can now be supplied internally. This enables deeper drilling.

■ Reduction of Burrs at Hole Exit



Part Material: Alloy Steel
Tool: MDF 0500S2D (ø5.0mm 2D)
Cutting Conditions: V_c=213 SFM, f=0.0047", H=0.393", 150 holes, Wet
Machine: Vertical machining center (BT40)

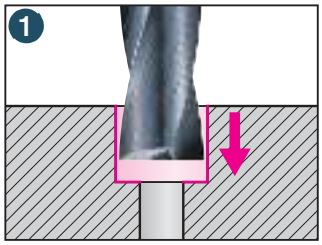
Reduces exit burrs by **half** compared with general-purpose drills



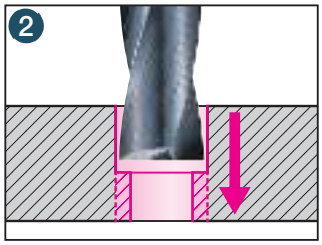
Flat MultiDrill MDF Type

Conventional general-purpose drill

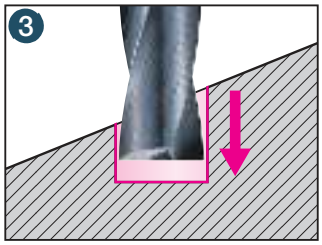
■ Machining Applications



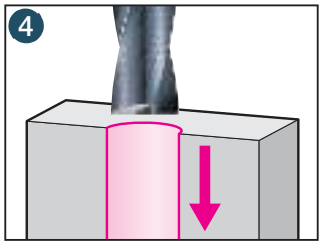
High-efficiency spot facing



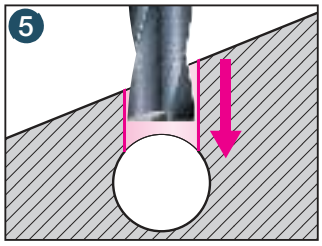
Hole expansion drilling



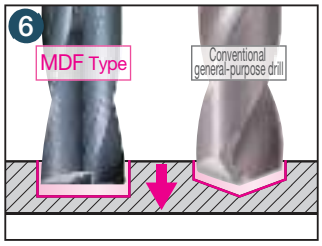
Drilling in non-horizontal surface (inclined surface, cylindrical surface, etc.)



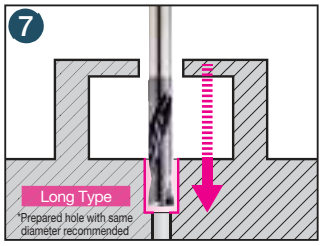
Interrupted drilling



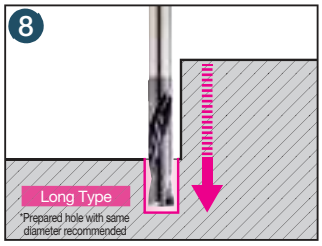
Cross drilling



Pre-tap hole drilling in thin sheets



Spot facing in deep positions



Avoids interference with work material

Long shanked type (L2D) for flat base drilling, hole expansion and burr control in long overhang conditions.

- For drilling with long overhang and to avoid interference with the workpiece

*A prepared hole with the same diameter or centering hole with a larger diameter than the tool is needed for drilling with the long type.

DC < 6mm, stepped shank

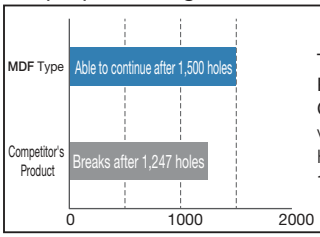
DC ≥ 6mm, relief shank

H Type with oil hole (3D/5D) for 2-5D deep hole applications

- Internal coolant supply enables deep flat hole drilling.

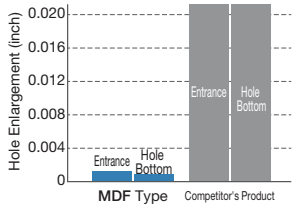
*A prepared hole with the same diameter or centering hole with a larger diameter than the tool is needed for drilling with an L/D=5 oil hole.

Deep Spot Facing



Tool: MDF 0600H5D
Part Material: Carbon Steel ø6mm
Cutting Conditions:
v_c=459 SFM, f=0.006 IPR
H = 1.181" (5D), Internal Coolant Supply
1.772" overhang, prepared hole depth 0.118" (ø6)

Long Overhang Spot Facing



Tool: MDF 0600H3D
Part Material: Carbon Steel
Cutting Conditions:
v_c=295 SFM, f=0.004 IPR
H = 0.709 (3D), Internal Coolant Supply
Overhang 1.378"

Drilling on slanted surfaces

Tool: MDF 0500S2D
Part Material: Alloy Structural Steel
Cutting Conditions:
v_c=213 SFM, f=0.003 IPR
H = 0.393", External MQL

Prevents burrs and conical remnants on tool withdrawal

Tool: MDF 1000S2D
Part Material: Low Carbon Steel
Cutting Conditions:
v_c=246 SFM, f=0.0047 IPR
H = 0.197", External MQL

■ Distinguishing flat drills, general-purpose drills and endmills

Tool	Flat Drill MDF Type		General-Purpose Drill GS/HGS Type		Endmill for Spot Facing GSXMILL Slot	
Shape of hole base						
Drilling in flat surfaces	○	Approx. 1/2 the feed of a general-purpose drill	◎	Best	△	Only for low feed 1D or smaller ≤1/5 the feed of a general-purpose drill
Drilling non-flat surfaces	◎	Ideal (2D or smaller recommended)	×	Impossible	○	Only for low feed 1D or smaller ≤1/2 the feed of a flat drill
Traverse Cutting	×	Impossible	×	Impossible	◎	Best

■ Product Range

Coolant Supply	Cat. No.	Diameter Range (mm)	Hole Depth (L/D)	Number of items

Recommended Cutting Conditions

1. The recommended hole depth is 2 x DC. The depth is measured from the highest point of the hole when drilling in inclined surfaces.
2. The recommended cutting conditions are those for drilling in flat horizontal surfaces.
3. Adjust the feed rate according to the inclination angle when drilling in an inclined surface.
4. Set the feed rate at 70% or lower when the inclination angle is 30° or less.
5. Set the feed rate at 50% or lower when the inclination angle is larger than 30°.
6. This product is a drilling tool. Do not use it for traverse cutting or helical milling.

(v_c: Cutting Speed (m/min), f: Feed Rate (mm/rev))

Grade: ACF75

*A prepared hole with the same diameter or centring hole with a larger diameter than the tool is needed for drilling with this tool.

★: Worldwide Warehouse Item

MDF-L Type Long Type (External Coolant Supply)

Recommended Cutting Conditions

1. A prepared hole with the same diameter is needed for drilling with this tool.
2. A prepared hole with the same diameter is recommended for the cutting conditions.
3. The recommended hole depth is 5 x DC. The depth is measured from the highest point of the hole when drilling in inclined surfaces.
4. This product is a drilling tool. Do not use it for traverse cutting or helical milling.

(v_c: Cutting Speed (m/min), f: Feed Rate (mm/rev))

*A prepared hole with the same diameter or centring hole with a larger diameter than the tool is needed for drilling with the 5D tool.

★: Worldwide Warehouse Item

Recommended Cutting Conditions for 3D

1. The recommended hole depth is 3 x DC. The depth is measured from the highest point of the hole when drilling in inclined surfaces.
2. The recommended cutting conditions are those for drilling in flat horizontal surfaces.
3. Adjust the feed rate according to the inclination angle when drilling in an inclined surface.
4. Set the feed rate at 70% or lower when the inclination angle is 30° or less.
5. Set the feed rate at 50% or lower when the inclination angle is larger than 30°.
6. This product is a drilling tool. Do not use it for traverse cutting or helical milling.
7. A prepared hole with the same diameter is recommended for machining of stainless steel.

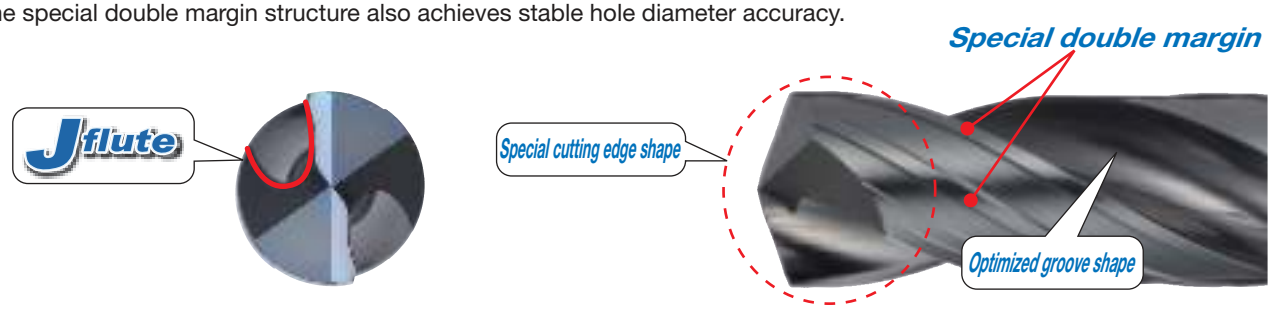
MEMO

■ General Features

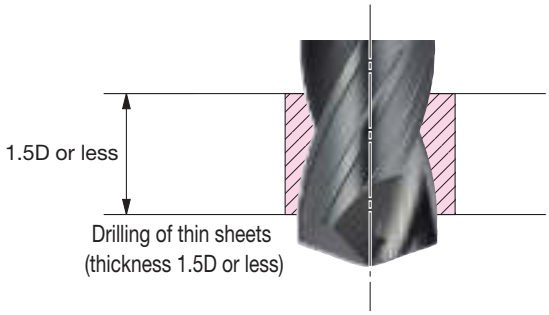
The J flutes of the Super MultiDrill WGS have been tuned for improved chip breaking capabilities during drilling of thin sheets.
Excellent sharpness prevents work hardening from drilling.
The special double margin structure also achieves stable hole diameter accuracy.

■ Features and Applications

J flutes (groove shape) have been tuned to create a specialized shape for drilling of thin sheets.
The special double margin structure also achieves stable hole diameter accuracy.



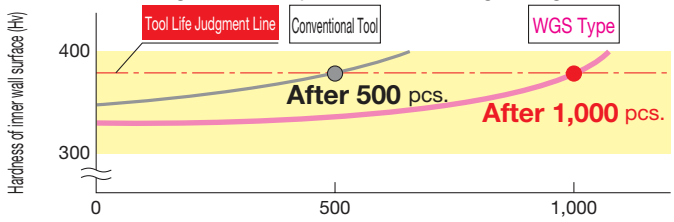
■ Target Workpieces



[Common automotive components]
·Bearing hub (inner and outer rings)
·Knuckle
·Differential ring
·Components such as bolt holes in automobile flange parts

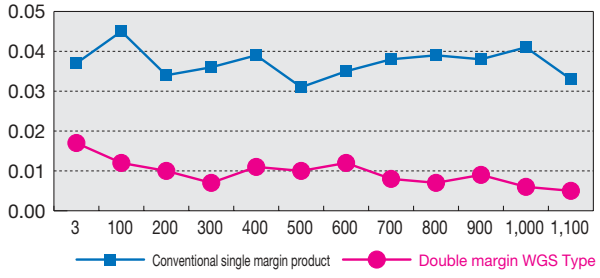
■ Cutting Performance

● Reduces hardening of the workpiece surface during drilling



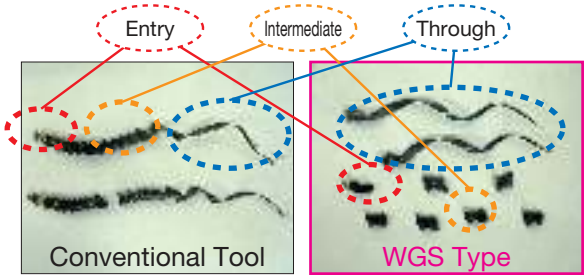
Work Material: S53C
Cutting Conditions: v_c=230 SFM, f =0.008 IPR
H=0.512”

● Stable hole expansion tolerance



Work Material: S50C
Cutting Conditions: v_c=262 SFM, f =0.01 IPR
H=0.630”

● Better chip breaking capabilities

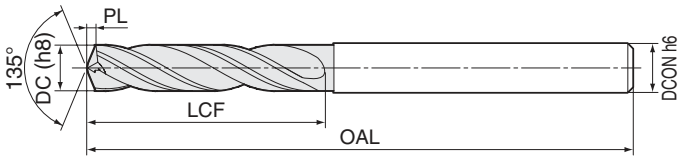


Work Material: SUJ2
Cutting Conditions: v_c=262 SFM, f =0.01 IPR
H=.512”

DEX Coating 2D

*Refer to N74 for the tolerance of h6 and h8

Fig 1



This product is a made-to-order item. Please specify the hole diameter (including tolerance) when ordering.

Grade: ACX70

Recommended Cutting Conditions

(v_c: Cutting Speed (m/min), *f*: Feed Rate (mm/rev))

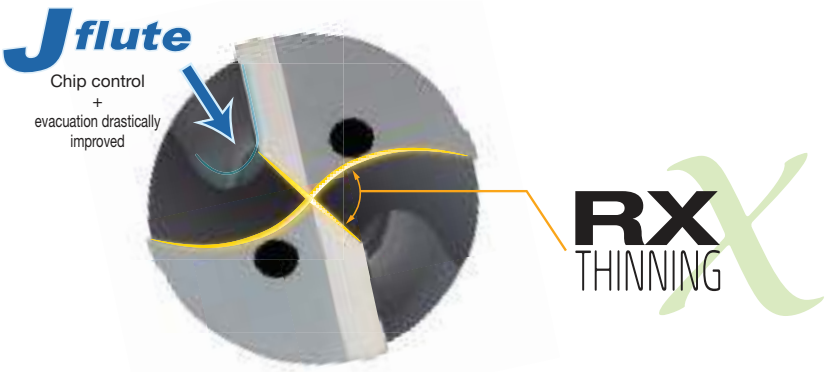
Dia. DC (mm)	Cutting Conditions	Mild Steel/General Steel (up to 300HB)	Stainless Steel (up to 200HB)	Gray Cast Iron FC250	Ductile Cast Iron FCD450
ø10.0	v_c	50 - **80** - 130	15 - **40** - 60	50 - **60** - 80	50 - **60** - 70
	f	0.20 - **0.25** - 0.35	0.10 - **0.15** - 0.20	0.20 - **0.30** - 0.35	0.20 - **0.25** - 0.35
ø16.0	v_c	60 - **100** - 140	20 - **40** - 60	60 - **80** - 100	50 - **60** - 80
	f	0.25 - **0.30** - 0.35	0.10 - **0.15** - 0.20	0.25 - **0.30** - 0.35	0.25 - **0.30** - 0.35

Min. - **Optimum** - Max.

* The recommended cutting conditions are also affected by factors such as machine rigidity and the workpiece clamping. Please adjust the cutting conditions according to your work environment.
* If work hardening occurs during drilling, it is recommended to use a lower speed than the recommended cutting conditions.

■ General Features

Strong MultiDrill HX Type is a special drill for cast iron that combines reduced cutting resistance and improved drill strength to achieve stable and high efficiency drilling of cast iron.



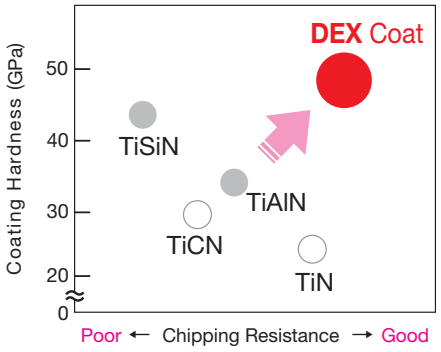
■ Features and Applications

- High-Efficiency Drilling of Cast Iron

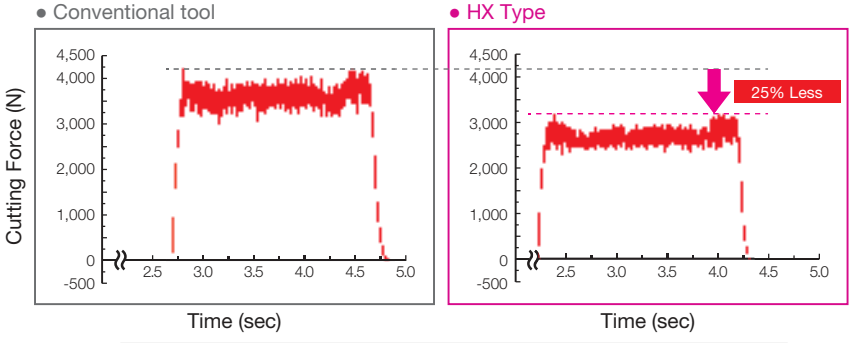
  Thick web and special double margin design ensure stable behavior even in high-efficiency drilling.
  Furthermore, RX THINNING drastically reduces cutting force and ensures more stable and efficient drilling.
  Enables high-efficiency drilling at speeds of over v_f=39.4 IPM. (for ø10mm sizes)

- Long Tool Life

  DEX Coat for drills utilizes nano-coating technology that provides more than double the tool life of conventional coatings. The drill guide function is enhanced through optimization of the margin position to prevent breakage due to hole bending.

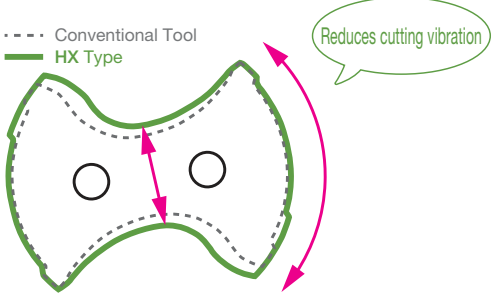


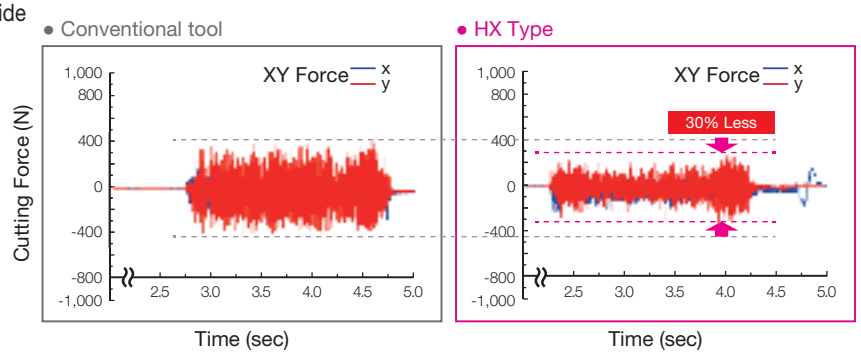
Low Resistance Wide chip pocket reduces thrust resistance.



Part Material : Grey Cast Iron, Tool: Conventional tool, MDW 1250HX5 (ø12.5mm 5D)
Cutting Conditions : v_c=328 SFM, f=0.024 IPR, H=1.979", internal coolant supply (water soluble)

High Rigidity Combination of large web thickness and wide land reduces vibration.



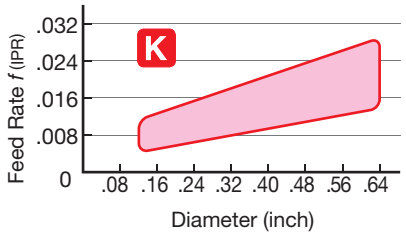


Part Material : Grey Cast Iron, Tool: Conventional tool, MDW 1250HX5 (ø12.5mm 5D)
Cutting Conditions : v_c=328 SFM, f=0.024 IPR, H=1.979", internal coolant supply (water soluble)

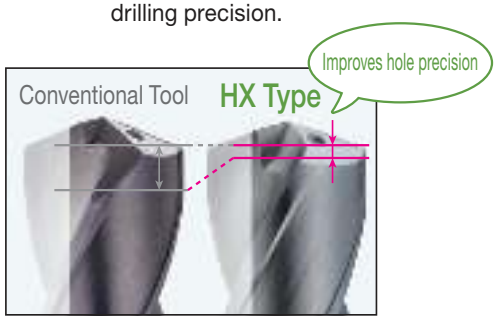
■ Product Range

Coolant Supply	Cat. No.	Diameter Range (mm)	Hole Depth (L/D)	Number of items
Internal	MDW□□□□HX3	ø3.0 to ø20.0	up to 3	108 items in stock
	MDW□□□□HX5	ø3.0 to ø20.0	up to 5	108 items in stock
	MDW□□□□HX8	ø3.0 to ø18.0	up to 8	32 items in stock

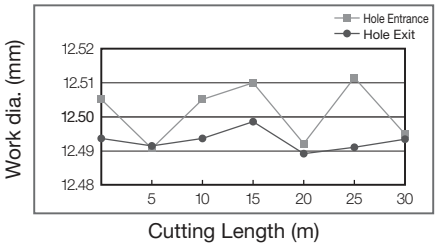
● Drilling of gray cast iron



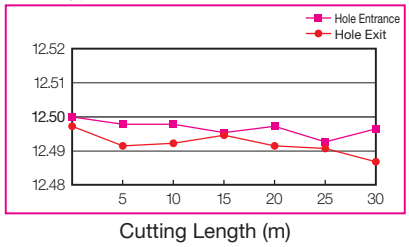
High Precision Improved margin point provides improved drilling precision.



● Conventional tool



● HX Type



Part Material : Grey Cast Iron, Tool: Conventional tool, MDW 1250HX5 (ø12.5mm 5D)
Cutting Conditions : v_c=328 SFM, f=0.024 IPR, H=1.979", internal coolant supply (water soluble)

Longer Tool Life High-feed cutting reduces margin wear and extends tool life.
→ Maintains replacement frequency (cutting time) and enables high efficiency drilling.

● Conventional tool

Cutting Conditions: f =0.012 IPR, cutting length: 98 ft. (cutting time 39 minutes)

● HX Type

Cutting Conditions: f =0.012 IPR, cutting length: 98 ft. (cutting time 39 minutes)

Cutting Conditions: f =0.024 IPR, cutting length: 197 ft. (cutting time 39 minutes)

Part Material: Grey Cast Iron, Tool: Conventional tool, MDW 1250HX5 (ø12.5mm 5D)
Cutting Conditions : v_c=328 SFM, f=0.024 IPR, H=1.979", internal coolant supply (water soluble)

Double the feed

■ Application Examples

Machine Component Grey Cast Iron

·Tool: MDW 1850HX5 (ø18.5mm 5D)
·Drilling Distance: 164 ft.
·Cutting Conditions: v_c=230 SFM, f =0.035 IPR,
H=88.6 ft. (stop), internal coolant supply (water soluble)

Reduced cutting edge wear in ultra-high-speed drilling.

Cutting Edge Rake Face Condition after Preset Tool Life

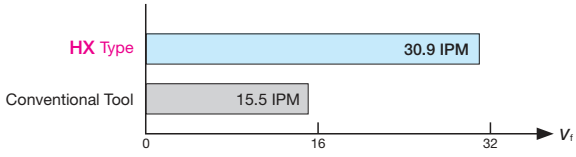
Competitor's High-Efficiency Drill

HX Type

Facility Component Ductile Cast Iron

·Tool: MDW 0850HX5 (ø8.5mm 5D)
·Drilling Distance: 164 ft.
·Cutting Conditions: v_c=230 SFM, f=0.012 IPR v_f=30.9 IPM,
H=88.6 ft. (stop), internal coolant supply (water soluble)

Double the drilling efficiency of conventional tools.



Engine Component Ductile Cast Iron

·Tool: MDW 1200HX3 (ø12.0mm 3D)
·Drilling Distance: 164 ft.
·Cutting Conditions: Conventional Tool: v_c=179 SFM, f =0.0087 IPR, v_f=11.48 IPM
HX Type: v_c=164 SFM, f =0.0157 IPR, v_f =20.88 IPM
H=91.9 ft. (stop), internal coolant supply (water soluble)

Stable cutting performance with 1.8 times the drilling efficiency of conventional tools.

Cutting Edge Wear Comparison after Fixed Tool Life

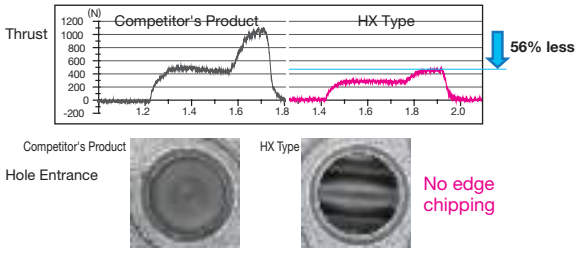
Conventional tool (f =0.0087 IPR)

HX Type (f =0.0157 IPR)

Machine Components (Sintered Material)

·Tool: MDW 0570HX3
·Cutting Conditions: v_c=230 SFM, f=0.035 IPR H=88.6 ft. (stop),
internal coolant supply (water soluble)

Less resistance and edge chipping than competitor's products!



HX Type (Internal Coolant Supply)

Cast Iron | Ductile Cast Iron

DEX Coating | Coolant Hole | 3D | 5D | 8D

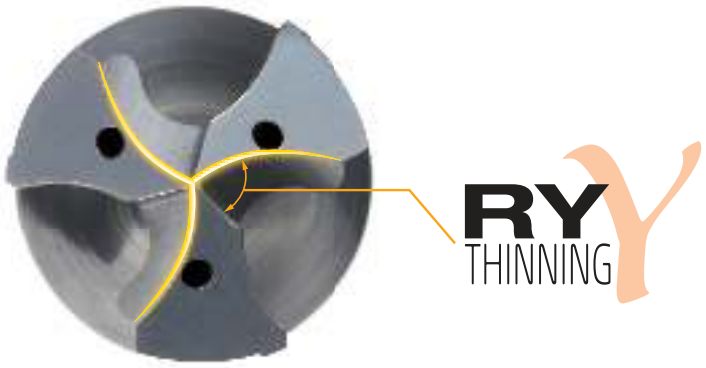
■ General Features

Strong MultiDrill HY Type is a 3-flute drill that achieves stability and high efficiency in machining of steel and cast iron, reducing the load on each flute and extending the tool life.



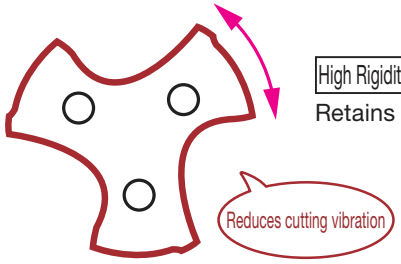
■ Features and Applications

● High-Efficiency Drilling of Steel and Cast Iron

Thick web and 3-point margin design ensure stable hole diameter accuracy in high-efficiency drilling.
RY THINNING also reduces cutting force in high-efficiency drilling.
Applicable to cutting conditions exceeding v_f=31.5 IPM in steel drilling and v_f=39.4 IPM in cast iron drilling. (for ø10mm sizes)

● Long Tool Life

DEX Coat for drills utilizes nano-coating technology to provide more than double the tool life of conventional coatings.
3-point margin design gives excellent guide performance for vibration control and long, stable tool life.



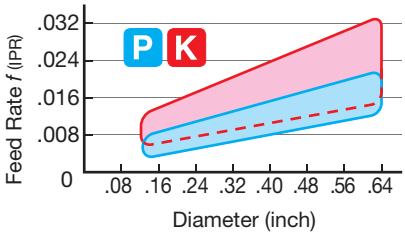
High Rigidity
Retains high rigidity with wide land.

Evacuation
Drastically improved chip control and evacuation

■ Product Range

Coolant Supply	Cat. No.	Diameter Range (mm)	Hole Depth (L/D)	Number of items
Internal	MDW□□□□HY3	ø5.0 to ø16.0	up to 3	23 items in stock
	MDW□□□□HY5		up to 5	23 items in stock
	MDW□□□□HY8		up to 8	6 items in stock

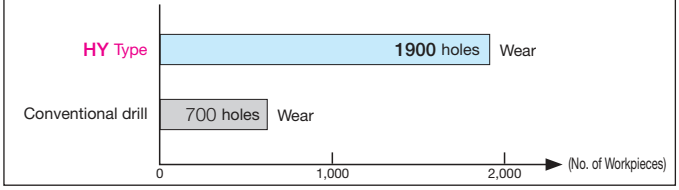
● Drilling of general steel and gray cast iron



■ Application Examples

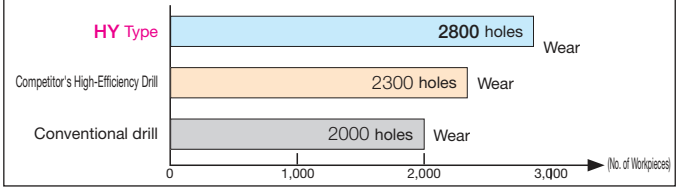
Machine components Alloy Steel
·Tool: MDW 1250HY3 (ø12.5mm 3D)
·Cutting Conditions: Conventional Tool : v_c=295 SFM, f =0.01 IPR, v_f=22.6 IPM
HY Type : v_c=230 SFM, f =0.0157 IPR, v_f=28 IPM
H=12mm (through), internal coolant supply (water soluble)

1.25 times the efficiency and 2.7 times the tool life of conventional drills



Machine components Ductile Cast Iron
·Tool: MDW 1020HY3 (ø10.2mm 3D)
·Cutting Conditions: Conventional Tool : v_c=230 SFM, f =0.011 IPR, v_f=24 IPM
HY Type : v_c=262 SFM, f =0.024 IPR, v_f=59 IPM
H=28mm (stop), internal coolant supply (water soluble)

2.5 times the efficiency and +1.4 times the tool life of conventional drills (1.2 times the tool life of competitors' high-efficiency drills)



HY Type (Internal Coolant Supply)

DEX Coating | Coolant Hole | 3D | 5D | 8D

SGS Type

■ General Features

SGS type drills for heat-resistant alloys employ a sharp cutting edge to reduce heat during drilling (reduce cutting force) and provide a long, stable tool life.

■ Features and Applications

Long tool life

- Combination of optimised cutting edge design and dedicated grade significantly reduces wear.
- Minute honing (edge treatment) amount and special thinning shape reduce cutting force. This reduces cutting edge breakage.
- Perfect for drilling Ni-based heat-resistant alloys (Inconel/Waspaloy/Hastelloy).

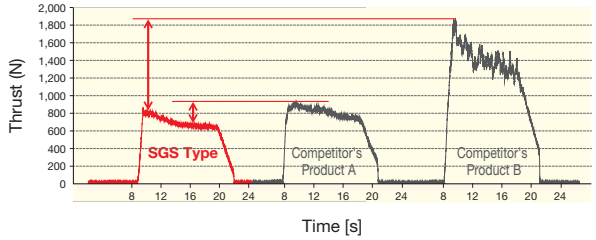
■ Product Range

Cat. No.	Diameter Range (mm)	Hole Depth (L/D)
MDW□□□□SGS3	ø3.0 to 12.0	up to 3

■ Performance

Comparison of Cutting Force (Thrust)

Low Resistance (Reduced Load on Cutting Edge)



Tool Diameter : ø6.0
Part Material : Inconel 718
Cutting Conditions : v_c=33 SFM, f =0.003 IPR, H=0.315" (through), external coolant supply

Tool Life Comparison

Long Tool Life (No Fracturing or Breakage)

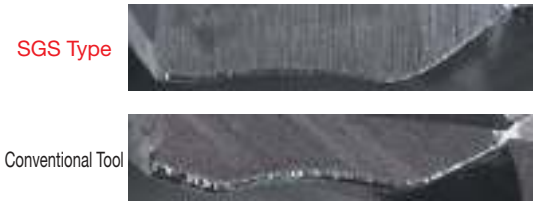
Tool	SGS Type	Competitor's Product A	Competitor's Product B
No. of Workpieces	Able to Continue after 50 Holes	Breakage after 30 Holes	Breakage after 5 Holes
Photo			

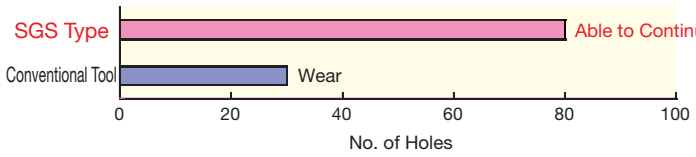
Tool Diameter : ø6.0
Part Material : Inconel 718
Cutting Conditions : v_c=33 SFM, f =0.003 IPR, H =0.630" (stop hole), external coolant supply

■ Application Examples

Comparison of Cutting Edge Wear after 30 Holes

Significantly Reduced Flank Wear





Tool : MDW 0600SGS3
Part Material : Inconel 718 (aeronautic components)
Cutting Conditions : v_c=33 SFM, f =0.0023 IPR, H=0.118" (through), external coolant supply

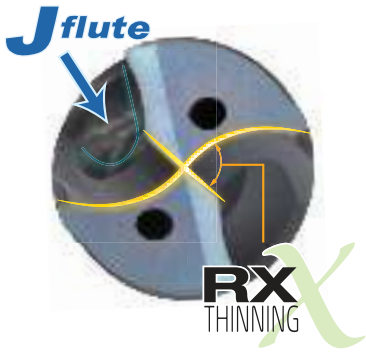
■ General Features

Super MultiDrill XHGS type, a next-generation drill specialized for deep hole drilling, features high drill strength and stable chip control to further enhance efficiency of deep hole drilling.

■ Features

- Deep hole drilling
  - New groove shape (J flute) achieves improved chip control during deep hole drilling
  - High-efficiency drilling at over v_f=39.37 IPM at depths 20 times the drill diameter (diameter ø5, equivalent to S48C)
  - Special web thinning shape (RX thinning) reduces cutting force during high-efficiency machining
- Long tool life
  - Special DEX Coat provides long tool life on a wide variety of work materials
  - Improved chip evacuation makes it possible to reduce spindle load fluctuation, ensuring long, stable tool life
- Eco-Friendly
  - Compatible with the MQL (Minimum Quantity Lubrication) system
  - Compatible with dual-fluid mist (simultaneous spray of oil and water)



■ Product Range

Applications	Cat. No.	Diameter Range (mm)	Hole Depth (L/D)	Number of items
Deep Hole Drilling	MDW□□□□XHGS10	ø2.1 to 16.0	up to 10	76 items in stock

	MDW□□□□XHGS15	ø2.1 to 16.0	up to 15	76 items in stock
	MDW□□□□XHGS20	ø2.1 to 14.0	up to 20	72 items in stock
	MDW□□□□XHGS25	ø2.1 to 12.0	up to 25	68 items in stock
	MDW□□□□XHGS30	ø2.1 to 10.0	up to 30	64 items in stock
For Guide Holes	MDW□□□□PHT	ø2.1 to 16.0	up to 2	76 items in stock

■ Application Examples

● Automotive components (Medium Carbon Steel)

Tool : ø5.0x115mm (PHT Type), ø5.0x170mm (XHGS Type)
Machine : Horizontal single-spindle NC machine
Coolant : MQL (air pressure 0.5MPa, volume approx. 4cc/h)
Cutting Conditions : v_c=262 SFM, f =0.011 IPR, H =3.346" per hole (3 holes per unit)
Tool life : 500 units (371 ft.)

● Automotive components (Structural Carbon Steel)

Tool : ø6.0x170mm (PHT Type), ø6.0x230mm (XHGS Type)
Machine : Horizontal single-spindle NC machine
Coolant : MQL (air pressure 0.5MPa, volume approx. 40cc/h)
Cutting Conditions : v_c=262 SFM, f =0.007 IPR, H =4.33" per hole (4 holes per unit)
Tool life : 150 units (371 ft.)

● Automotive components (Ductile Cast Iron)

Tool : ø5.0x105mm (PHT Type), ø5.0x155mm (XHGS Type)
Machine : Horizontal single-spindle NC machine
Coolant : MQL (air pressure 0.4MPa, volume approx. 4cc/h)
Cutting Conditions : v_c=165 SFM, f =0.007 IPR H =2.362" per hole (5 holes per unit)
Tool life : 400 units (394 ft.)

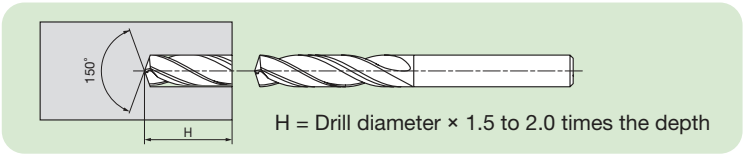
● Machine components (1045 Steel)

Tool : ø6.0x90mm (PHT Type), ø6.0x145mm (XHGS Type)
Machine : Horizontal single-spindle NC machine
Coolant : MQL (air pressure 0.5MPa, volume approx. 60cc/h)
Cutting Conditions : v_c=262 SFM, f =0.0078, H =2.44" per hole (3 holes per unit)
Tool life : 550 units (341 ft.)

■ Recommended Drilling Method

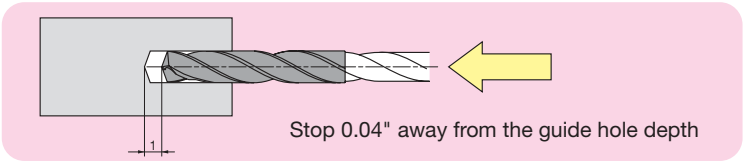
(1) Make a guide hole using the PHT type

- Select the same nominal diameter for the PHT type dedicated guide hole drill as the XHGS type deep hole drill. (The guide drill diameter is designed to be 0.02 mm to 0.05 mm larger than the long drill diameter.)



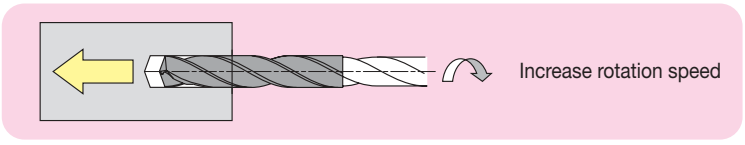
(2) Feed the XHGS type deep hole drill through the guide hole at low rotation speed

- Spindle Speed: 500 RPM
- Feed Rate: 39 to 78 IPM



* If the drill is inserted into the guide hole at the set cutting speed, peripheral run-out may cause damage to the drill's peripheral edges.

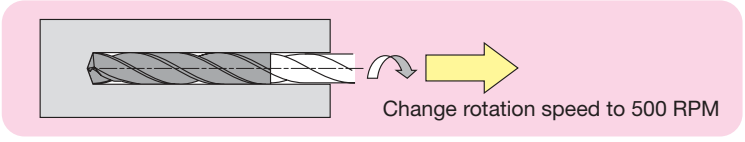
(3) Increase rotation speed until the set cutting speed is reached, then start normal drilling operation



* On some NC machines, the feed command may be activated before the set spindle speed is reached, so it is recommended to enter a dwell sequence before the feed command.

(4) After drilling, rotation speed is reduced and the drill is retracted from the work material

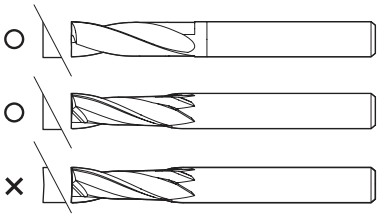
- Spindle speed: 500 RPM Feed rate: 39 to 78 IPM



* Retracting a drill from the work material at a high rotation speed is dangerous as doing so may result in breakage due to runout.

(5) Other notes

- A flat base should be prepared first if the entry side is a non-flat surface (slanted surface, cylindrical surface, etc.).



Spot facing using an endmill or flat MultiDrill MDF type (see page J44)

Concave ended endmills cannot be used.

- If the exit side is a non-flat surface, reduce the feed rate to f=0.002 IPR immediately before the breakthrough point to prevent the drill from breaking or burrs from forming.

■ Coolant

(1) Internal coolant supply

- Use coolant equivalent to JIS A1-1 (emulsion).
- Pump pressure Steel: 1. 5 to 2. 0MPa (higher pressure results in a stronger cooling effect, which affects chips and wear)
  Cast iron and aluminum alloy: 4. 0 to 6. 0MPa (prioritize cooling performance)

(2) Internal MQL

- Air pressure : 0.5MPa or greater
- Evacuation volume : It is recommended to set the maximum evacuation volume for your equipment.
  *Consult the manufacturer if you intend to machine aluminum alloy.

(3) Internal dual-fluid mist

- Air pressure : 0.5MPa or greater
- Evacuation volume : It is recommended to use the optimal setting for your equipment.

XHGS Type / PHT Type (Internal Coolant Supply)

■ Features

- High-efficiency drilling

  DLC Coating (AURORA Coat) and low resistance WL (Wide L) thinning drastically reduce cutting force.

- Stable drilling performance

  Special cutting edge design and WW (Wide W) margin improve hole quality.

- Long tool life

  DLC Coating (AURORA Coat) coupled with the cutting edge shape acheives a long and stable tool life.

- Deep hole drilling

  Drills for deep hole drilling can be made to oder.
  (Production range: Drill diameters: ø3.0 to ø16.0mm
  Overall length: Available on inquiry)

■ Product Range (Stocked Sizes)

Coolant Supply	Cat. No.	Diameter Range (mm)	Hole Depth (L/D)
Internal	**MDW□□□□NHGS3**	ø3.0 to 16.0	up to 3
	MDW□□□□NHGS5		up to 5
	MDW□□□□NHGS10	ø3.0 to 13.0	up to 10

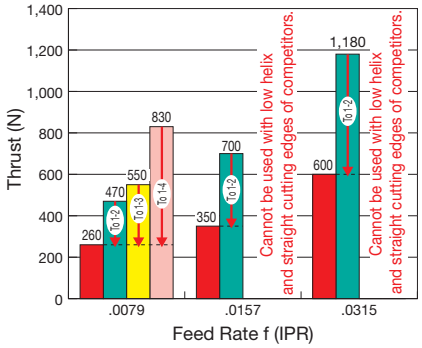
■ Performance

Cutting force

- Low cutting force, achieving 2 to 4 times the feed rate

  The cutting force of the NHGS Type is
  1/2 that of competitors' 30° helix drills > double the feed rate!
  1/3 that of competitors' light helix drills > 3x the feed rate!
  1/4 that of straight-blade drills > 4x the feed rate!

Thrust



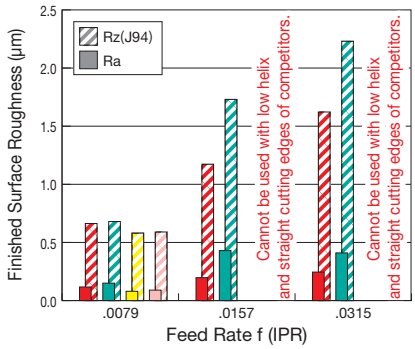
Tool: MDW 0800NHGS5 (DL1300)	Part Material: Aluminum Alloy Die Casting
Cutting Speed: v_c=656 SFM	Machine: Vertical machining centre (BT30)
Coolant: Internal supply (1.5MPa)	Coolant: Emulsion (dilute to around 25x)

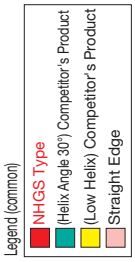
Machined surface quality

- Achieves good surface roughness over a wide range of feed rates

  Good surface roughness from low to high feed rates:
  Ra=0.11 to 0.25
  Rz (J94)=0.66 to 1.62

Finished Surface Roughness





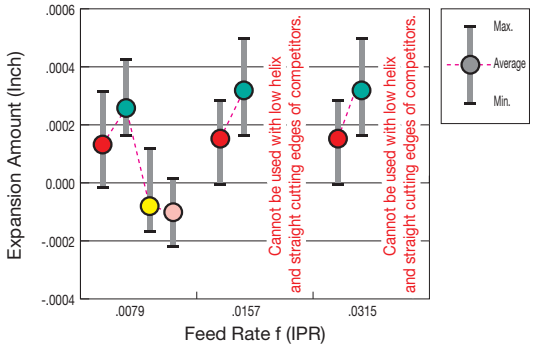
Tool: MDW 0800NHGS5 (DL1300)	Part Material: Aluminum Alloy Die Casting
Cutting Speed: v_c=656 SFM	Machine: Vertical machining centre (BT30)
Coolant: Internal supply (1.5MPa)	Coolant: Emulsion (dilute to around 25x)

Machined hole accuracy (hole expansion)

- Stable hole accuracy with hole expansion within 0.01mm

  Achieves minimal expansion and stable machining from low to high feed rates

Hole diameter expansion



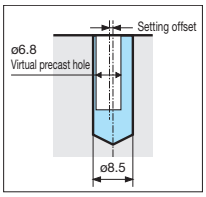
Tool: MDW 0800NHGS5 (DL1300)	Part Material: Aluminum Alloy Die Casting
Cutting Speed: v_c=656 SFM	Machine: Vertical machining centre (BT30)
Coolant: Internal supply (1.5MPa)	Coolant: Emulsion (dilute to around 25x)

Machined hole accuracy (hole position accuracy)

- Pre-cast hole accuracy within ±1/10 to ±1/5 of axial offset

Pre-cast hole accuracy (hole position accuracy)

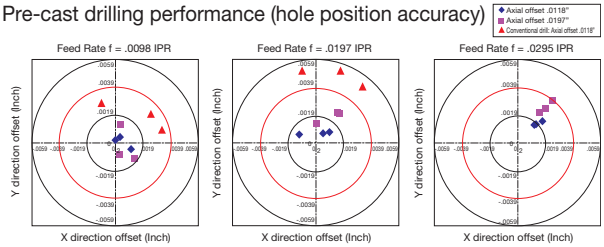
Offset \ Feed Rate	0.25mm/rev	0.50mm/rev	0.75mm/rev
0.3mm	±0.03mm	±0.04mm	±0.06mm
0.5mm	±0.05mm	±0.07mm	±0.10mm
Conventional drill: 0.3mm	±0.09mm	±0.19mm	



- Test method

An axial offset of 0.3mm to 0.5mm is set for a virtual pre-cast hole (ø6.8) and a hole is drilled with an ø8.5 drill before measuring the deviation from the target position.

Pre-cast drilling performance (hole position accuracy)



Tool: MDW 0850NHGS5 (DL1300)	Part Material: Alluminum Alloy
Cutting Speed: v_c=656 SFM (n=7, 489 RPM)	Machine: Vertical machining centre (BT30)
Coolant: Internal supply	

NHGS Type - INCH (Internal Coolant Supply)

SDC Type (External Coolant Supply)

■ General Features

Diamond Coating SDC type (SUMIDIA) drills for carbon fiber reinforced polymers (CFRP) employ Sumitomo's proprietary multi-step point angle. Combined with a diamond coating, this technology improves machined surface quality and extends tool life.

■ Features and Applications

- Excellent Drilled-Hole Quality
  - Sharp cutting edge shape reduces delamination of fiber layers and minimizes burrs.
  - Continuously changing point angle, disperses the load placed on the cutting edge and preventing breakage.
- Long Tool Life
  - Utilizing a high-strength diamond coating with excellent adhesion, delivering high quality and long tool life.

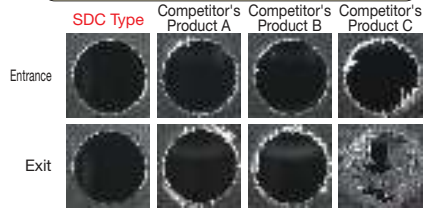
■ Product Range

Cat. No.	Diameter Range (mm)	Point Angle	Hole Depth (L/D)
MDS□□□□□SDC3	ø2.0 to ø4.0	90°	up to 3
	ø4.851 to ø10.0	130°	

■ Performance

Comparison of Machined Surface Quality

Excellent machined surface quality
Prevents delamination and burrs



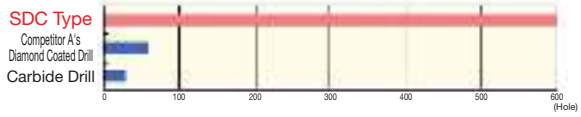
Tool: SUMIDIA COAT Drill SDC Type ø6.35
Part Material: CFRP
Cutting Conditions: *n* =6,000 SFM, *f* =0.004 IPR *H* =91.86" (through), dry

Tool Life Comparison

Effects of Diamond Coating

SDC Type (After Drilling 600 Holes)	Competitor's Product (After Drilling 50 Holes)
	No delamination Minimal flank wear	Large delamination from cutting edge to flank

Stable diamond layer adhesion prevents delamination.
Excellent wear resistance enables high-quality drilling with long tool life.



Tool: SUMIDIA COAT Drill ø6.35
Part Material: CFRP
Cutting Conditions: *n* =6,000 SFM, *f* =0.003 IPR, *H* =49.2" (through), dry

SUMIDIA Coat **3D**

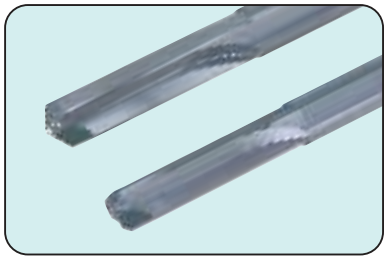
PCD 3D



From General to High Precision Drilling of Aluminum Alloys

- High precision DAL type is able to produce holes of IT Class of 7 to 8.
- General DDL type is able to produce holes of IT class 11 to 12, mainly for pre-tap hole drilling.

This product is a made-to-order item.

Min. - **Optimum** - Max.

Important Notes

- When using DAL type for high precision machining, select a high rigidity machine and high precision holder.
- Supply coolant generously at the entrance of the hole.

MLDH-L / MLDH-P Type

■ General Features

Micro Long Drills are oil-hole drills for high efficiency drilling that were developed for drilling deep, small-diameter holes. These next-generation drills for small diameter deep holes feature improved strength - addresses a frequent problem with small diameter drills.

■ Features and Applications

- Deep hole drilling
  New groove shape ensures good drill rigidity and chip evacuation.
  High-efficiency drilling to depths of over 20 times the drill diameter at over v_f=500mm/min (drill diameter ø1.3, Stainless Steel). Optimal thinning and edge balance for stable chip control.
- Long tool life
  Special coating provides long tool life with a wide variety of work materials.
  Improved chip evacuation makes it possible to reduce spindle load fluctuation, ensuring long, stable tool life.

Part Number Suffix P: For Guide Hole
Grade: ACV70

★: Worldwide Warehouse Item

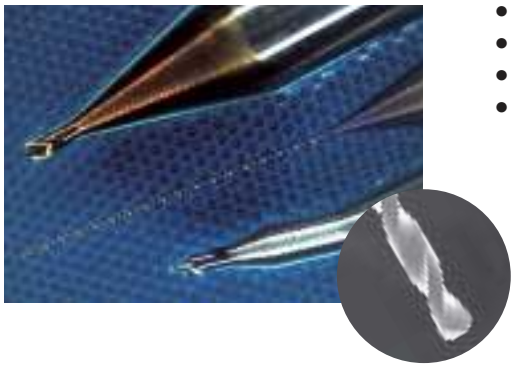
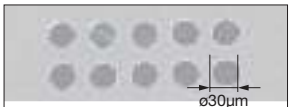
For Steel, Stainless Steel and Other Metals



■ Micro Drill: MDUS ø0.03 to ø0.19mm

- High-precision shank (Shank tolerance h3, circularity 0.3µm or less, cylindricity 0.5µm or less)
- New ultra-thin TiAlN coating gives improved wear resistance
- Perfect for drilling steel, stainless steel, or copper
- Available from ø0.03 mm to ø0.19 mm in 0.005 mm increments

■ Application Examples

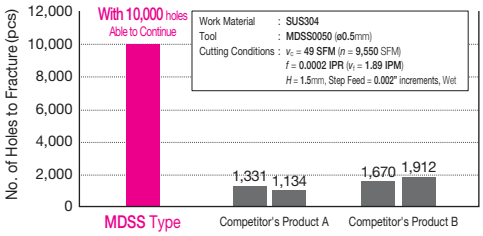


Part Material : 304 Stainless Steel
Tool : MDUS 0030-30C (ø0.03mm)
Cutting Conditions : n = 15,000 RPM, v_f = 0.118" IPM
Step Feed = 0.0001"

Part Material : 316 Stainless Steel
Tool : MDUS 0100-30C (ø0.04")
Cutting Conditions : n = 20,000 RPM, v_f = 0.787 IPM
Step Feed = 0.0004"

■ Solid Carbide MINI Drill: MDSS ø0.20 to ø1.00mm

- The combination of a hard, tough carbide substrate and a high-rigidity design (web thickness, flute width ratio, helix angle) greatly improves fracture resistance
- PVD coating dedicated for small drills significantly extends tool life
- Can be used for a wide range of work materials including carbon steel, alloy steel, die steel, and stainless steel
- Shanks standardised to ø3mm diameter and overall length of 38mm for greater ease of use



MDSS Recommended Cutting Conditions (Wet) <Inquire about cutting conditions for the MDUS type>

1. The conditions at left are recommended under wet conditions, using water-soluble coolant.
2. If cutting noise and vibration are present, please adjust the cutting conditions accordingly.
3. If the machine cannot achieve the standard spindle speed, please use the maximum spindle speed available. In this case, lower the feed rate by the same ratio.

* Step feed is recommended for drilling of holes deeper than 3xD (D=drill diameter).

■ Micro Pointing Drill MDUP ø0.03 to ø0.18mm

- For drilling guide holes for MDUS drills

For Ceramics and Non-metals

■ Made-to-order Fine Drills ø0.02mm up

- Dedicated cutting edge designs are available for various work materials including non-metals, ceramics, and resins
- Customized designs are also available for improved efficiency, such as integration of processes by using a stepped drill
- Various drill diameters (from ø0.02) and LxDs are available to order (Contact us for possible profiles)

★: Worldwide Warehouse Item

■ Features

Indexable type drill with exchangeable drill head,
which has a radial serration design, for high precision and strength.
An exchangeable drill head provides a new cutting edge,
higher productivity and cost efficiency with easy tool management.
Regrinding allowance of 0.059" to 0.118" (*1.5mm to 3mm*)
makes further tool cost reductions possible.* Regrinding is available only for MTL/MEL/MB Type

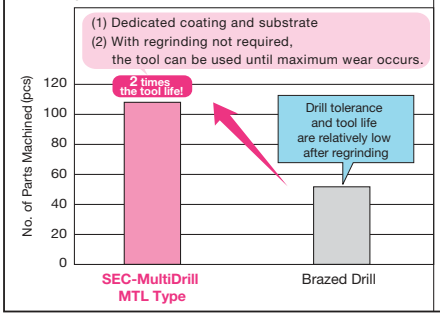
■ Product Range List

Tip	Holder (L/D)	Applications	$øD_c$ range
MTL	S (1.5D)	General Steel	ø0.4688" to ø1.2125" (ø12.0 to ø30.8mm)
	M (3D)		ø0.4688" to ø1.6732" (ø12.0 to ø42.5mm)
	L (5D)		ø0.4688" to ø1.6732" (ø12.0 to ø42.5mm)
	D (8D)		ø0.5315" to ø1.6732" (ø13.5 to ø42.5mm)
	12D (12D)		ø0.5315" to ø1.0157" (ø13.5 to ø25.8mm)
MEL	S (1.5D)	Stainless Steel, Super Alloy, Cast Iron	ø0.4688" to ø1.2125" (ø12.0 to ø30.8mm)
	M (3D)		ø0.4688" to ø1.2125" (ø12.0 to ø30.8mm)
	L (5D)		ø0.4688" to ø1.2125" (ø12.0 to ø30.8mm)
	D (8D)		ø0.5315" to ø1.2125" (ø13.5 to ø30.8mm)
	12D (12D)		ø0.5315" to ø1.0157" (ø13.5 to ø25.8mm)
MFS	S (1.5D)	Spot Facing	ø0.4688" to ø1.2125" (ø12.0 to ø30.8mm)

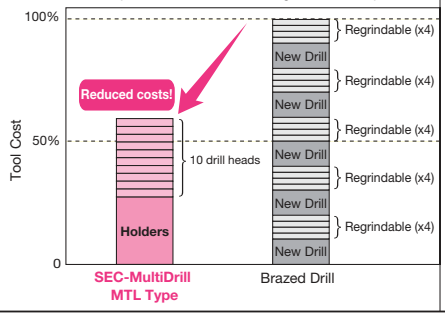
*MFS Type can also be used with M Type, L Type, D Type and 12D Type holders.

■ Tool Life and Cost

● Comparison of tool life



● Total tool comparison when machining 1,000 workpieces



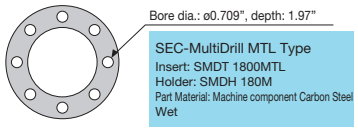
● Conclusion

For regrinding purposes, brazed drills are only used for **50-70%** of their actual tool life potential. **SEC-MultiDrill MTL Type reaches 100%!**

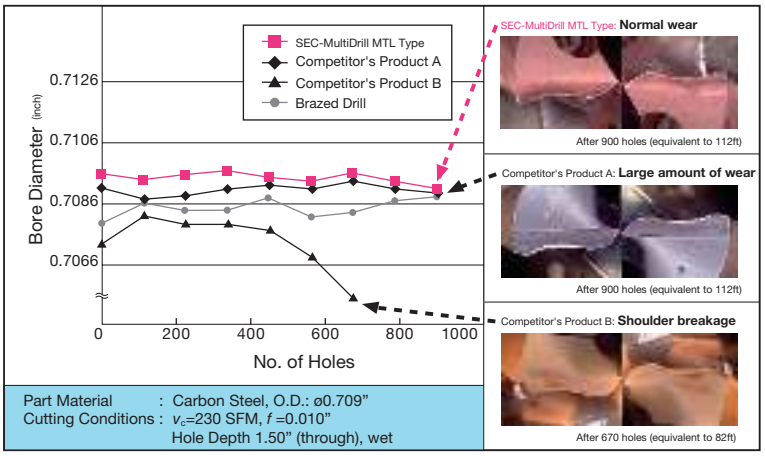
MTL Type has **double the tool life of brazed drills!**

Shorter tool change time!

● Workpiece Example



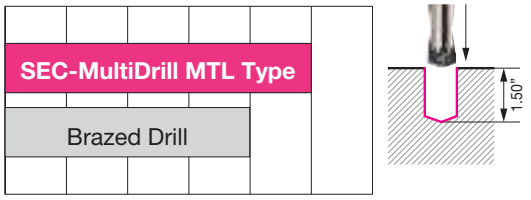
■ Drilling Precision



Part Material : Carbon Steel, O.D.: ø0.709"
Cutting Conditions : v_c=230 SFM, f =0.010"
Hole Depth 1.50" (through), wet

■ Tool Strength

● Durability Comparison

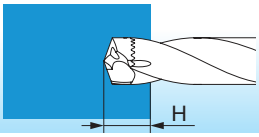


Part Material : Carbon Steel, O.D. : ø0.630"
Cutting Conditions : v_c=262 SFM
Hole Depth : 1.50"

■ Recommended drilling method for 12D Type: Use a collet, hydro chuck or milling chuck to hold the 12D drill body (tapered collet chuck cannot be used)

(1) Drill a guide hole with SMDHOOOM (3D holder) + MTL Type (head)

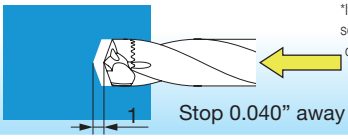
● Use a 3D drill body and a drill head with the same diameter as the 12D (same cat. no.) when drilling the guide hole.



H = Drill diameter x 1 to 1.5 times the depth

(2) Feed the SMDHOOO-12D (12D holder) + MTL Type (head) through the guide hole at a low spindle speed

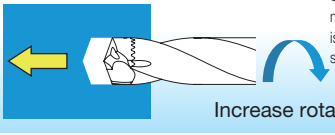
● Spindle speed: 500 RPM ●Feed rate: 39.37 IPM to 78.74 IPM



*If the drill is inserted into the guide hole at the set cutting speed, peripheral run-out may cause damage to the drill's peripheral edges.

Stop 0.040" away from the guide hole depth

(3) Increase spindle speed until the set spindle speed is reached, then start drilling

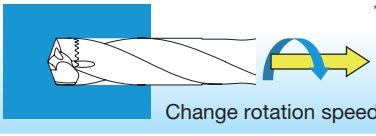


*On some NC machines, the feed command may be activated before the set spindle speed is reached, so it is recommended to enter a dwell sequence before the feed command.

Increase rotation speed

(4) After drilling, rotation speed is reduced and the drill is retracted from the work material

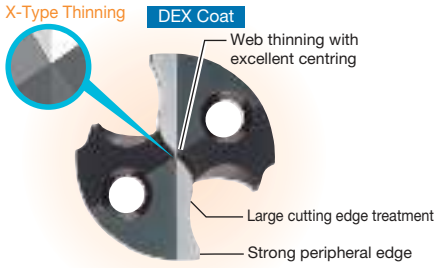
● Spindle speed: 500 RPM●Feed rate: 39.37 IPM to 78.74 IPM



*Retracting a drill from the work material at a high spindle speed, is dangerous as doing so may result in breakage due to runout.

Change rotation speed to 500 RPM

MTL Type Suitable for high-efficiency drilling of general steel

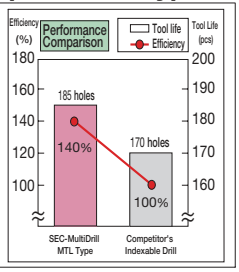


- **Excellent cutting edge strength**
  Large edge treatment is used to reduce breakage of the cutting edge.
- **Stable machined hole accuracy**
  X Type thinning achieves excellent centring on entry and stable drilling.

■ Application Examples: MTL Type

Improved tool life and efficiency

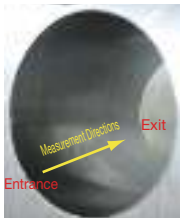
Part Material : Housing Mild Steel
Drill Size : For ø15x5D
Cutting Conditions : v_c=351 SFM
f=0.0118 IPR
Hole Depth : 1.26" × 12 holes

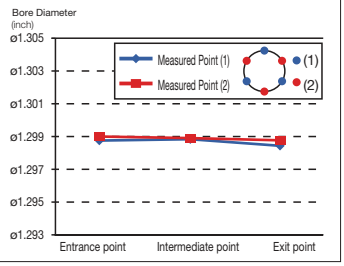


■ Drilling Precision

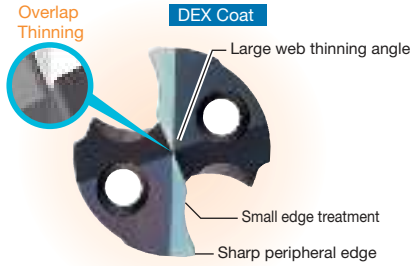
High drilling accuracy even with large diameters

Part Material : Structural Steel Plate
(base substrate for construction machinery)
Drill Size : For ø33x5D
Cutting Conditions : v_c=393 SFM
f=0.0098 IPR
Cutting Environment : Emulsion Type



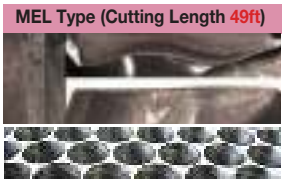


MTL-C Type Chamfered edges to eliminate break out in cast iron
MEL Type Suitable for exotic alloys such as stainless steel, mild steel, gray cast iron and low rigidity equipment



- **Excellent cutting edge design for SUS and mild steel (SS, etc.)**
  Large thinning angle solves the convex corner breakage issues specific to mild steel and reduces adhesion breakages with SUS.
- **Improved edge chipping resistance in cast iron**
  Edge sharpness improvements in peripheral areas prevent edge chipping around hole openings in cast iron.

■ Application Examples (MEL Type)



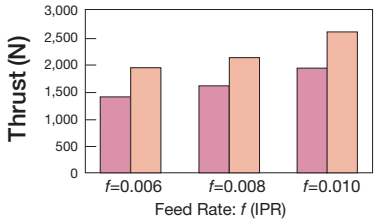
SEC-MultiDrill MEL type has excellent centring, produces no rifle marks and no cutting edge breakage after 49ft.

Competitor's indexable drill exhibited poor centring and produced rifle marks. The centre of the drill broke after 36ft of drilling.

Part Material: 304 Stainless Steel, Drill size: For ø14x5D
Cutting Conditions: v_c=197 SFM, f=0.006", coolant: Emulsion

■ 25% reduction in cutting force (thrust)

- The MEL type features 25% lower thrust than the MTL type!



Part Material: Carbon Steel
O.D.: ø0.551"
Cutting Conditions: v_c=262 SFM

Sharper blade type and thinning overlap significantly reduce thrust and improve chip control, allowing stable drilling in low-rigidity setups.

■ Recommended Cutting Conditions

Speed: v (SFM) / Feed: f (IPR)

★ = Worldwide Warehouse Item

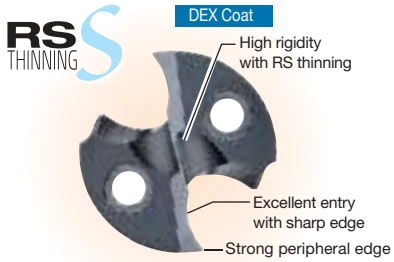
MFS Ideal for drilling and burr control on non-flat surfaces

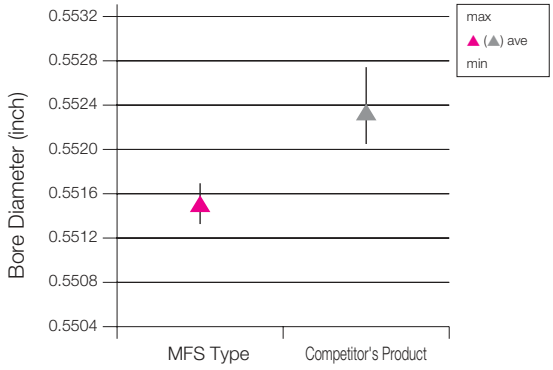


Suited to various types of drilling thanks to a point angle of 180°
Can be used for high-efficiency spot facing, drilling on non-horizontal surfaces such as inclined and cylindrical surfaces, and interrupted drilling. Also reduces burrs at the hole exit.

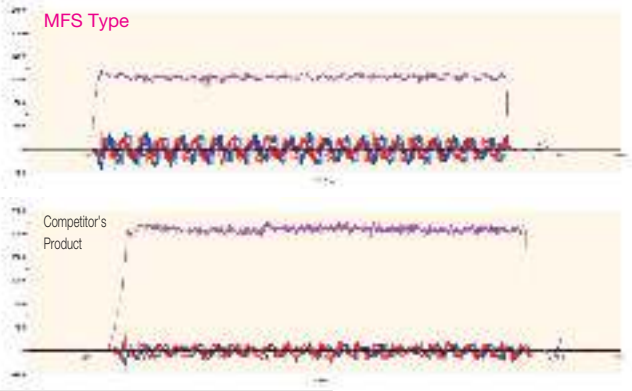
Improves machining stability
Achieves high rigidity by employing RS THINNING, which ensures thick web at the bottom.

■ Perfor...

Comparison of Hole Diameter Accuracy



Comparison of Cutting Force



Tool : SMDH 140S + SMDT 1400MFS
Part Material : Carbon Steel
Cutting Conditions : v_c=328 SFM, f =0.006 IPM, Hole depth 0.827", Wet

■ Precautions when Using MFS Type Heads

Application	No guide hole (final hole only)	With guide hole	Flat finishing of hole bottom
	 Flat surface / Non-flat surface	 Guide Holes	1.5D holder	o	o (guide hole not needed)	o
3D to 12D holders	×	×	o

Note:
1. The recommended hole depth is 2 x drill diameter. The depth is measured from the highest point of the hole on drilling in inclined surfaces.
2. The recommended cutting conditions are those for drilling on flat horizontal surfaces.
3. Adjust the feed rate according to the inclination angle when drilling on an inclined surface.
4. Set the feed rate at 70% or lower when the inclination angle is 30° or less.
5. Set the feed rate at 50% or lower when the inclination angle is larger than 30°.
6. This product is a drilling tool. Do not use it for traversing or helical milling.

Recommended Cutting Conditions J102 | MFS Type Head J103

LU for 12D holder is the value with typical diameter.

★ = Worldwide Warehouse Item

Precautions when Using MFS Type Heads

Application	No guide hole (final hole only)	With guide hole	Flat finishing of hole bottom
	 Flat surface / Non-flat surface	 Guide Holes	1.5D holder	○	○ (guide hole not needed)	○
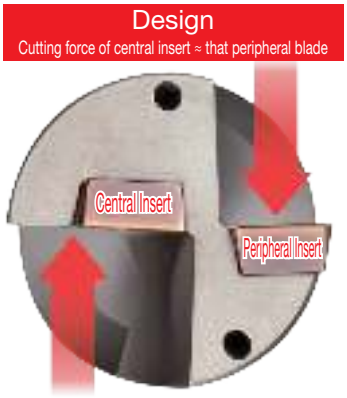
3D to 12D holders	×	×	○

N·m Recommended Tightening Torque (N·m)

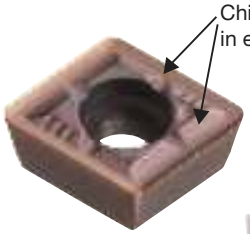
■ General Features

The SumiDrill WDX type has excellent cutting balance that provides stable hole drilling on a wide range of work materials from general steel to stainless steel and aluminum alloy. Available in three original chipbreaker styles, the inserts feature improved chip control and reduced cutting force for use in low-rigidity contexts.

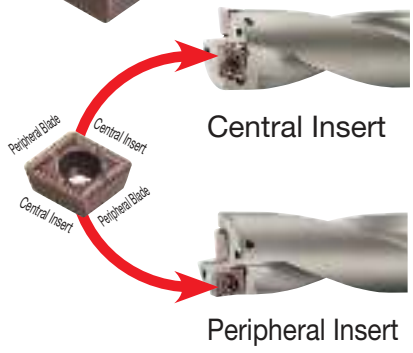


■ Features and Applications

- Balanced Design
  Cutting force during drilling is balanced between central insert and peripheral insert. The relative position of each insert is optimized to provide stable drilling.
- Excellent Chip Control
  The chip evacuation direction can be controlled with the chip control groove at the center of the breaker, enabling good chip control.
- Versatile Tool for a Variety of Machining Applications
  Select among three types of breakers for different applications, allowing optimal drilling for a variety of work materials and conditions. Suitable for a wide range of applications including hole expansion, spot facing, external turning and internal boring.
- Economical Four-Cornered Insert
  This product has an extremely economical design where a single insert type can be used for the central insert or peripheral insert, with two corners for each position - a total of four corners.



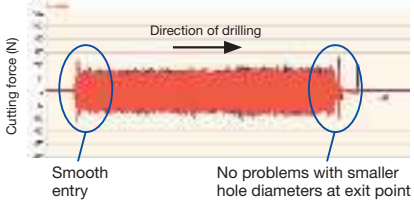
Type	L	G		H
Features	For low feed with chip control	General-purpose	For Non-ferrous Metal drilling	Strong Edge Type
Appearance				
Figure				



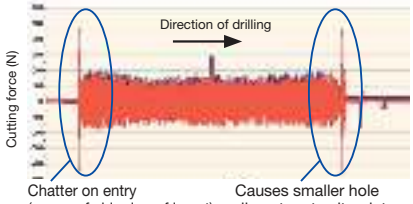
■ Performance

- Balanced Design (Comparison of Horizontal Component Values)
  Balance is maintained at the through hole entry and exit points, and drilling is stable.

SumiDrill WDX Type



Conventional and Competitor's Products



- Improved chip control

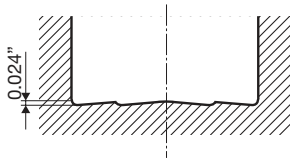
Drill: WDX 200D3S25 (ø20.0)
Part Mterial: 304 Stainless Steel
Cutting Conditions: v_c=427 SFM, f=0.0024 IPR
H=1.98", Wet

WDX

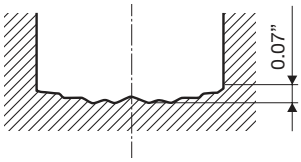
Conventional and Competitor's Products

- Finishing is easy because the hole bottom is almost flat.

Bottom of hole after drilling with WDX200D3S25



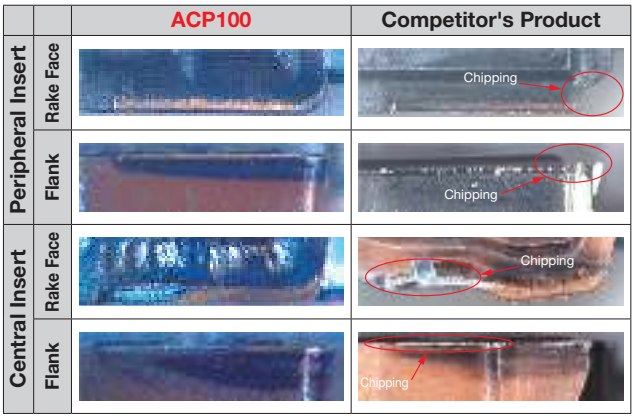
Bottom of hole after drilling with conventional tool (ø20)



For High-speed Drilling of Steel and Cast Iron
ACP100

■ Features

Provides excellent wear resistance and high reliability thanks to our coating stress control technology and the ultra-fine crystal grain coating film of the Super FF Coat achieved through our proprietary technology.

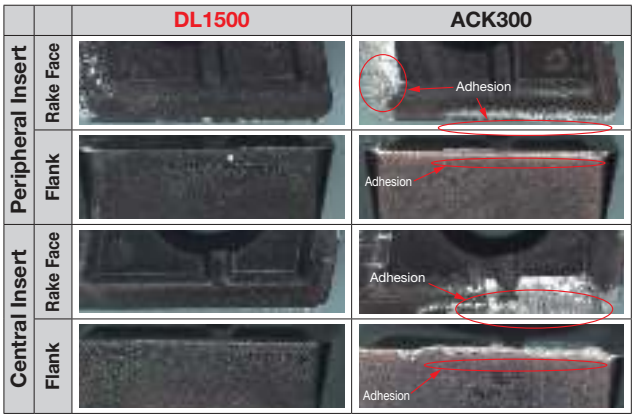


Holder: WDX 250D3S25
Insert: WDXT 063006-G (ACP100)
Part Material: Carbon Steel
Cutting Conditions: v_C=656 SFM, f=0.0047 IPR,
H=1.97" (through hole), Wet

For Drilling of Non-ferrous Metals
AURORA Coat DL1500

■ Features

New DL1500 insert grade for drilling non-ferrous metal offers greatly improved adhesion resistance compared to conventional tools.
Ideal for drilling holes in copper alloys as well as aluminum alloys.



Holder: WDX 250D3S25
Insert: WDXT 073506-G (DL1500)
Part Material: Aluminum Alloy Die Casting Parts For Engines
Cutting Conditions: v_C=492 SFM, f=0.0039 IPR,
H=1.97" (through hole), Wet

Drills for Deep Hole Drilling L/D = 5 (In stock from ø13.0 to ø55.0 mm)

■ Features

The SumiDrill WDX type for 5D drilling features a specially designed flute shape and enlarged coolant hole for excellent chip evacuation even during deep hole drilling.

Large coolant hole

Coolant supply guide

Special Flute Shape for L/D=5

■ Performance

Tool Holder Features	Figure	Cutting Force	Machined Surface (Exit)
WDX 260D5S32 **Special Flute Shape for L/D=5** * Designed with emphasis on chip evacuation Expanded flute design improves chip evacuation for stable drilling performance even with holes up to 5 L/D.			Good machined surface down to end of hole Other Tool **Flute Shape for L/D=4** * Designed with emphasis on drill rigidity Flute design enables greater rigidity of the drill, achieving stable drilling of shallow holes up to 4 L/D.			Poor machined surface due to chip blockage at bottom of hole (near 5 L/D) 
Part Material: 304 Stainless Steel, Insert: WDXT 073506-G
Cutting Conditions: v_C=492 SFM, f=0.002 IPR, H=5.118" (through hole), Wet

Insert Selection Guide —— The WDX insert series has a variety of options

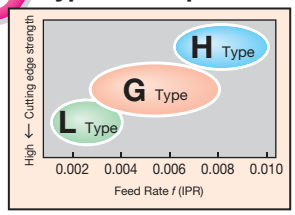
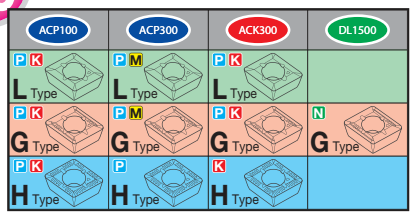
M Stainless Steel		○		
K Cast Iron (High-speed Milling)	○			
K Cast Iron (General Milling)			○	
N Non-ferrous Metal				○

3 Types of chipbreaker



10 Combinations!



2nd Recommendation (P)

P Steel — For low feed with chip control — L — ACP300

- For machining various types of Steel
- High speed and low feed is recommended if there are issues with chip control
- Decrease the feed rate if vibration occurs due to burnt chips

P Steel — General-purpose — G — ACP100

- For machining of general steel and alloy steel, when prone to significantly large flank wear

P Steel — For low feed with chip control — L — ACP100

- For low-feed conditions

P Steel — Strong Edge Type — H — ACP300

- For machining with interruptions (entry/through) due to diagonal entry, reduce the feed rate in the interrupted area (around f0.05)
- For insufficient cutting edge strength due to machining of hardened steel (heat treatment)

P Steel: Improved chip control (low carbon steel, etc.)

P Steel: Insufficient wear resistance

P Steel: Initial chipping measures (interruption, high hardness, etc.)

1st Recommendation (P M K N)

General-purpose — G

P Steel / M Stainless Steel: For general steel, alloy steel and stainless steel drilling — **ACP300**

K Cast Iron: For cast iron drilling — **ACK300**

N Non-Ferrous Metal: For non-ferrous metal drilling — **DL1500**

M Stainless Steel: Improved chip control

K Cast Iron: Insufficient wear resistance (high-speed machining)

K Cast Iron: Initial chipping measures (interruption, high feed, etc.)

2nd Recommendation (M K)

M Stainless Steel — For low feed with chip control — L — ACP300

- When it is not possible to increase the cutting speed or feed rate with the equipment being used and chip control is an issue

K Cast Iron — General-purpose — G — ACP100

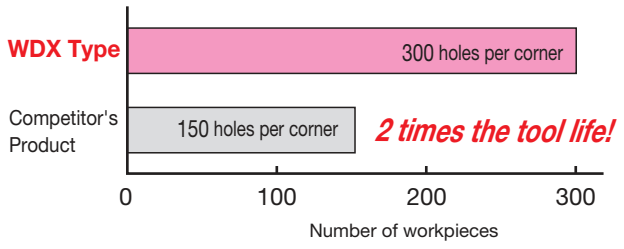
- When heavy flank wear occurs in cast iron drilling
- To limit wear in high-speed, low to medium feed conditions

K Cast Iron — Strong Edge Type — H — ACK300

- When interrupted cutting is performed due to diagonal entry, etc. as with steel drilling
- For insufficient cutting edge strength due to high-feed machining

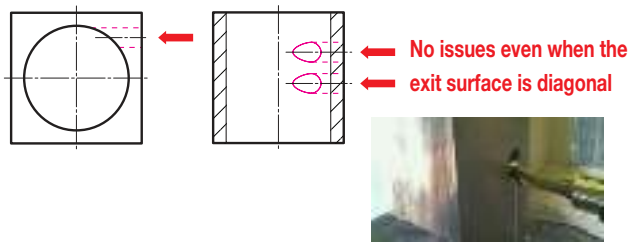
*ACP100 is the first recommendation for steel with a hardness of 200HB or greater, or for high-speed machining of steel.

■ Application Examples



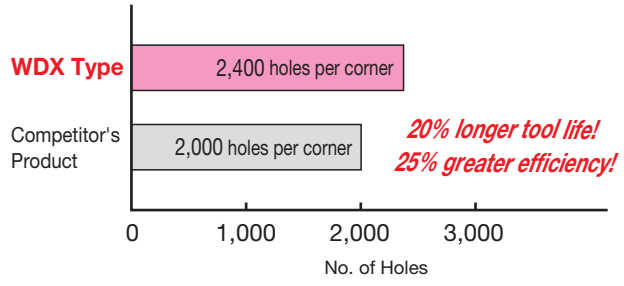
Part Material : Ductile Cast Iron Machine component
Tool : WDX 205D3S25
Insert : WDXT 063006-G (ACK300)
Cutting Conditions : v_c=400 SFM, f =0.006 IPR, H =1.3" , through, Wet

·Significant increase in tool life: twice that of conventional tools.
·Stable cutting with minimal cutting force.



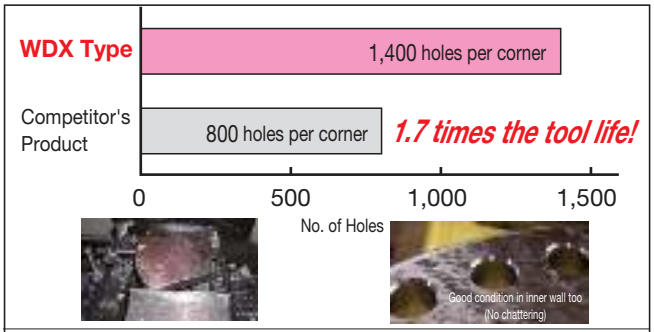
Part Material : Carbon Steel Plate
Tool : WDX 430D3S40, Insert : WDXT 125012-H (ACP300)
Cutting Conditions : v_c=446 SFM, f =0.0.006 IPR, H =2.36"+1.97" (semicircle area), through, Wet

·Enables stable drilling even in unstable cutting conditions (interrupted cutting at deepest point).
·Quieter cutting than conventional tools.



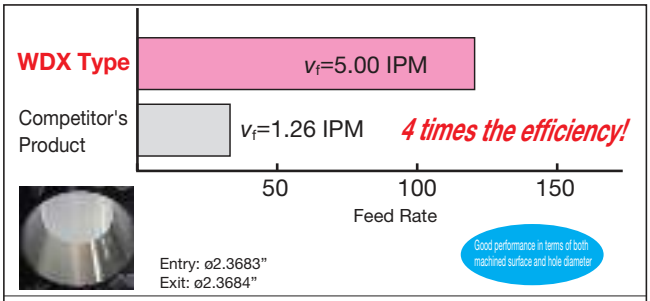
Part Material : 4140 Steel Machine component
Tool : WDX 200D3S25, Insert : WDXT 063006-G (ACP300)
Cutting Conditions : v_c=515 SFM, f =0.008" , H =0.748" , through, Wet
(competitor's product : v_c=515 SFM, f =0.006" , H =0.748" , through, Wet)

Good chip control even in high-efficiency conditions. Good stability with low vibration during cutting. 25% greater efficiency and 20% longer tool life.



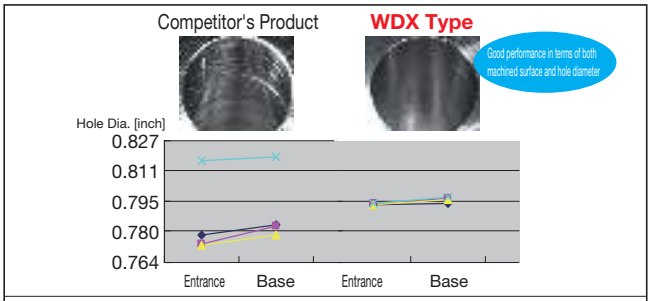
Part Material : Carbon Steel Plate
Tool : WDX 145D3S20, Insert : WDXT 042004-L (ACP300)
Cutting Conditions : v_c=673 SFM, f =0.0165" , H =0.591" , through, Wet

·Significant increase in tool life - 1.7 times longer.
·Good performance with no chatter on the machined surface, even with low-rigidity clamps.



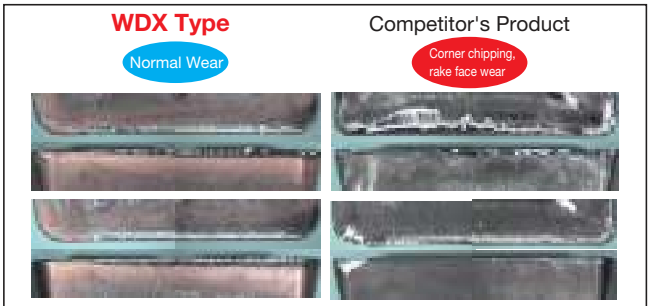
Part Material : Medium Carbo Steel Plate
Tool : WDX 600D3S40
Insert : WDXT 186012-G (ACP300)
Cutting Conditions : v_c=492 SFM, f =0.006 IPR, H =2.36" , through, Wet
(conventional tool :v_c=98 SFM, f =0.008 IPR, H =2.36" , through, Wet)

·Achieves steady machining even at large diameters!
·Achieves 4 times the efficiency of conventional tools!



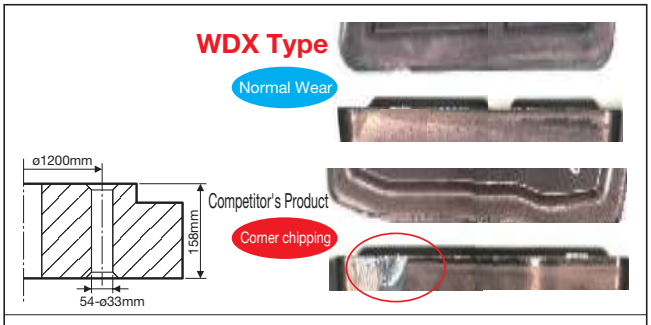
Part Material : Alloy Steel Machine component
Tool : WDX 200D5S25
Insert : WDXT 063006-G (ACP300)
Cutting Conditions : v_c=607 SFM, f =0.005 IPR, H =3.425" , through, Wet

·Good machined surface!
·Consistent bore diameter



Part Material : Carbon Steel Tractor links
Tool : WDX 205D5S25
Insert : WDXT 063006-G (ACP300)
Cutting Conditions : v_c=328 SFM, f =0.0043 IPR, H =2.36" , through, Wet

·Achieves steady machining even at L/D=5
·Reduces insert chipping and wear for stable tool life



Part Material : Alloy Steel Bearing for wind power generator
Tool : WDX330D5S40
Insert : WDXT094008-L (ACP300)
Cutting Conditions : v_c=479 SFM, f =0.004 IPR, H =0.622" , through, Wet

·Eliminates defects in workpieces caused by insert chipping!

For the P and K grades for which ACP300 and ACK300 inserts are the first recommendation, ACP100 inserts are the second recommendation.
In this case, it is recommended to set the cutting speed (V_c) to 130% and the feed rate (*f*) to 75% of the figures in the table above.

For the P and K grades for which ACP300 and ACK300 inserts are the first recommendation, ACP100 inserts are the second recommendation.
In this case, it is recommended to set the cutting speed (V_c) to 130% and the feed rate (*f*) to 75% of the figures in the table above.

WDX Type Inch 4D (Internal Coolant Supply)

For the P and K grades for which ACP300 and ACK300 inserts are the first recommendation, ACP100 inserts are the second recommendation.
In this case, it is recommended to set the cutting speed (V_c) to 130% and the feed rate (*f*) to 75% of the figures in the table above.

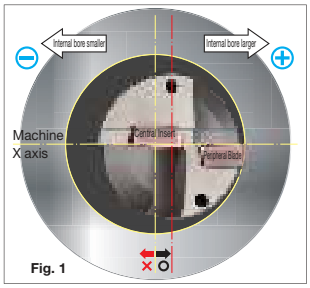
For the P and K grades for which ACP300 and ACK300 inserts are the first recommendation, ACP100 inserts are the second recommendation.
In this case, it is recommended to set the cutting speed (V_c) to 130% and the feed rate (*f*) to 75% of the figures in the table above.

■ Lathe Machining Guidelines



■ Drill Mounting

- Set the drill so that the peripheral insert is parallel to the X axis of the machine. (Fig.1)
- Press the end of the flange of the drill tightly against the face of the holder when tightening the bolt.

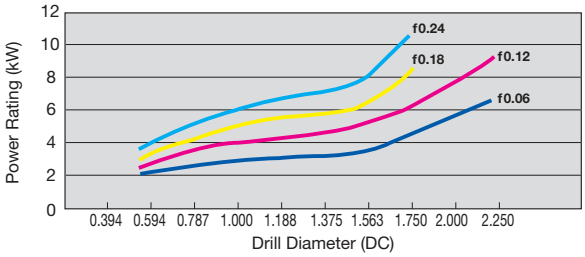
■ Adjusting work diameter (offset)

- The work diameter is adjustable by moving the machine X axis.
- Make the adjustment by moving in the positive direction of the X axis (enlarging the bore diameter). Moving the X axis in the negative direction (to reduce the bore diameter) is not recommended as the holder may interfere with the hole. (See Fig. 1)
- The maximum allowable adjustment (offset) differs depending on the drill diameter. Refer to Radial Offset (Max) in the Holder dimension tables on pages J111, J114, J117, J120.

■ Other notes

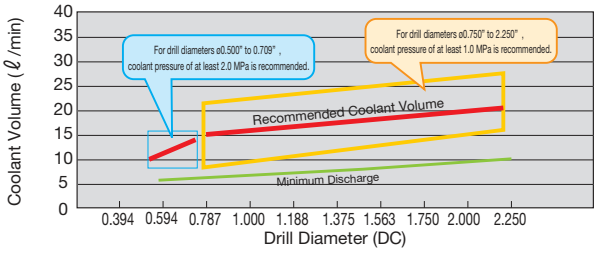
- When the drill is mounted on a lathe, the centre of the central insert is designed to be 0.15 to 0.2 mm below the centre of the spindle.
- If the spindle deviates so far off centre that the centre of the central insert lies above the spindle centre, the central insert will break.
- Set the depth of cut for turning or internal boring work to 1/5 or less of the drill diameter (max. 5 mm or less). (Example: Set depth of cut to 4 mm or less for a drill diameter of ø20 mm)
- Install a cover to prevent injury from possible chip fly-out (see disc-shaped chip in Figure 2) when through boring on a lathe. If your equipment has no cover, attach a cover or similar part for your safety.

■ Typical Power Ratings



<CAUTIONS>
- Power ratings are subject to change based on conditions such as work material and cutting speed, and should only be used for reference.
- Cutting Conditions (Reference)
  Work Material: S50C (230HB)
  Cutting Speed: v_c=492 SFM

■ Typical Coolant Volume

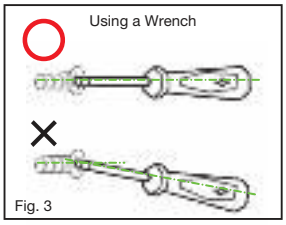


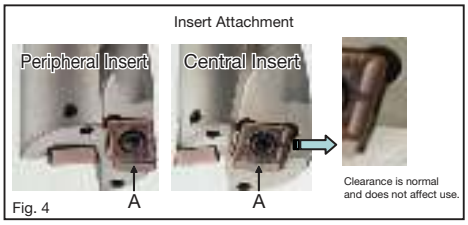
<CAUTIONS>
- Coolant volume is a factor that affects drilling performance, particularly with respect to chip evacuation and lubricity. This is particularly important for chip evacuation and lubricity.
- Coolant pressure should be set higher for small drills. (ø18.0 mm or smaller)
- Coolant volume is usually adjusted by changing the coolant pressure provided on most CNC machines.
- This table provides guideline values only. More coolant may be required depending on the machine, coolant and work material.

■ Precautions for Attaching and Removing Inserts

- Before mounting the insert, remove all traces of foreign matter on the insert seat using air or other means.
- When using the wrench, align it to the axis of the screw and press while turning. (See Fig. 3) If the wrench is not aligned with the screw, the insert will be insufficiently clamped and the tip of the wrench and/or the Torx hole of the screw may become deformed.
- Do not allow clearance between the insert seat and drill when mounting the insert (Fig. 4, Part A). Figure 4 shows a properly mounted insert.

* It is normal for the outer sides of the central insert to have clearance because it is clamped at its centre and pushed to the rear.





■ Troubleshooting

Problem	Symptom	Cause	Countermeasures
Too much variation in hole diameter	Drilled hole diameter is larger than desired	· Deflection of the holder due to high thrust force	· Decrease the feed rate to decrease the thrust force. · Make an adjustment on the X axis.
	Drilled hole diameter is smaller than desired	· The cutting edge backs off and does not enter the workpiece	· Increase the feed rate. · Make an adjustment on the X axis.
	Pronounced difference in hole diameter at entrance and bottom	· Packing of chips	· Increase the feed rate to improve chip evacuation. · Use an L type breaker for chip control.
Poor quality machined hole surface	Poor machined surface from entrance to bottom of hole	· High cutting force · Low rigidity of workpiece	· Decrease the feed rate. · Review tooling to improve rigidity.
	Poor machined surface at bottom of hole	· Machined surfaces damaged by chips	· Increase the feed rate to improve chip evacuation. · Use an L type breaker for chip control.
Insert is broken	Breakage on central insert (centre)	· Improper adjustment of centre height · Insert is not strong enough	· Check the centre height again. · If the drill is being used on a lathe, try flipping the drill 180°. · Use a strong edge chipbreaker (H type).
	Breakage on peripheral insert	· High cutting load in cutting edge	· Decrease the feed rate to decrease cutting load. · Use a strong edge chipbreaker (H type).

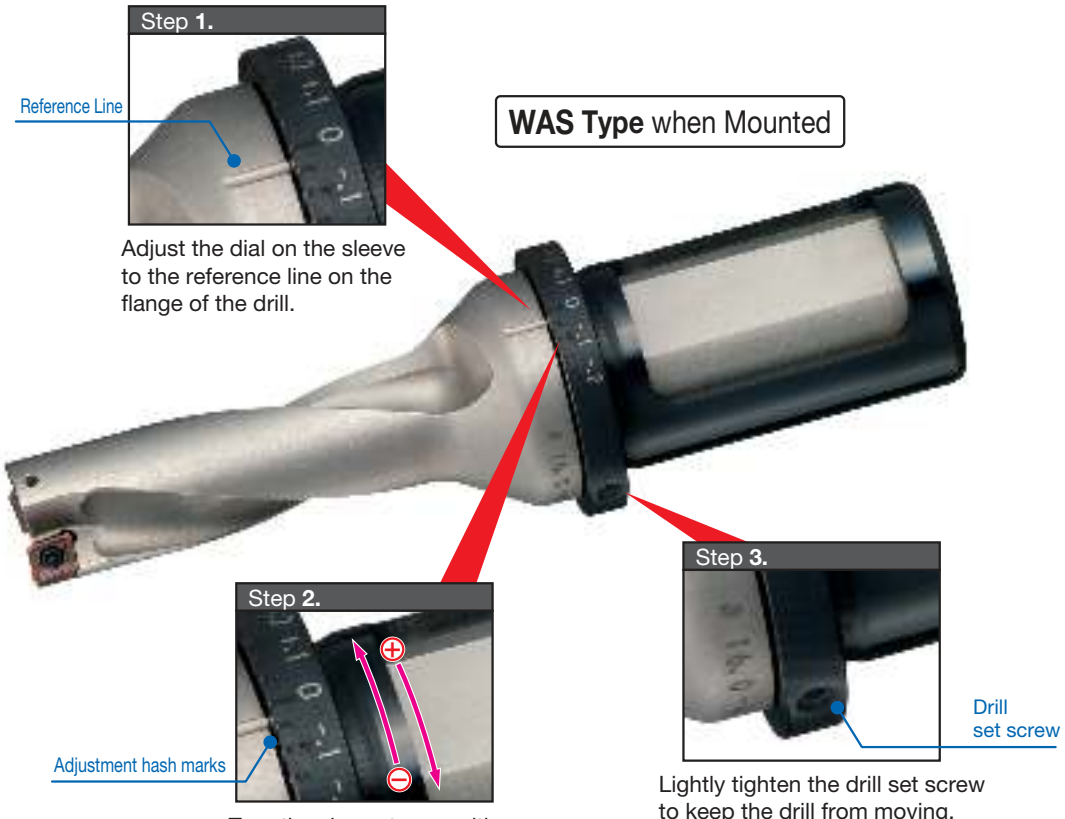
Diameter Adjustment Range indicates the range in which the diameter can be adjusted.
The dedicated Eccentric Sleeve WAS Type for the SumiDrill WDX Type provides ±0.3 mm of adjustment when drilling holes.

★: Worldwide Warehouse Item

Cautions for Use

1. The dial is for reference purposes. Always measure the actual work diameter and adjust accordingly.
2. Not usable with collet chuck type holders.
   Use a side-locking type holder.
3. Use this product under high rigidity conditions.
   This product is not recommended for deep hole drilling such as 5D and low rigidity conditions.

Directions (Adjusting the Work Diameter)



Adjust the dial on the sleeve to the reference line on the flange of the drill.

Turn the sleeve to a positive number to expand the work diameter, and to a negative number to decrease it.

Lightly tighten the drill set screw to keep the drill from moving.

WDX Type Inch 4D Side Port (Internal Coolant Supply)

■ General Features

Sumitomo Electric Carbide, Inc. is now offering WDX-L Indexable Drill with side port coolant. Due to not all spindles being coolant-thru, the WDX-L allows for customers to use coolant through the side port.

■ Features and Applications

- Diameters available in 0.5625" to 2.5000"
- WDX-L uses WDXT inserts (same as WDX style)
- Available in 4XD style

PDL Type / PCT Type

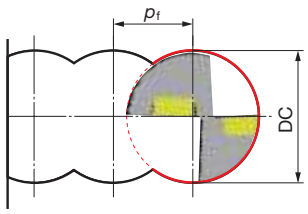
■ General Features

Cutting feed in the Z axis direction, where tool rigidity is high, allow high-efficiency, stable roughing for aeronautic components and dies with long tool overhang, where machining efficiency is hard to increase in long neck machining and pocketing.

■ Features

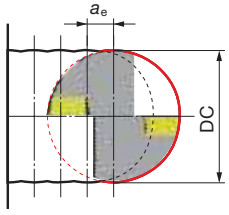
- The flat cutting edge design produces near-flat bottom profiles to reduce depth of cut variation during finishing.
- All sizes come with oil holes for supplying coolant internally to improve chip evacuation performance.
- Durable body with special surface treatment offers improved tool life and reliability.
- Utilizing SumiDrill WDX type inserts for handling a wide range of work materials, from steel to non-ferrous metals and exotic alloys.

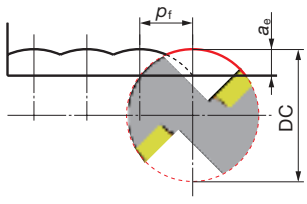
- The PDL type has a central insert, enabling radial depth of cut beyond the tool's radius, pick feed cutting and drilling. (Pocketing, etc.)



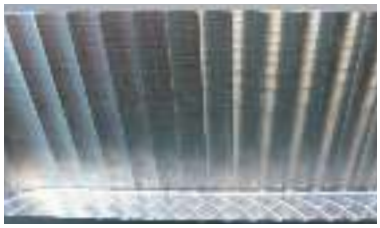
Keep the value of p_f for PDL type tools to less than 70% of the tool diameter (DC).

- Although the PCT type has limited radial depth of cut, the tool has a high effective number of teeth enabling it to perform high feed cutting. (Medium finishing of corners, hole expansion, deep groove processing, etc.)



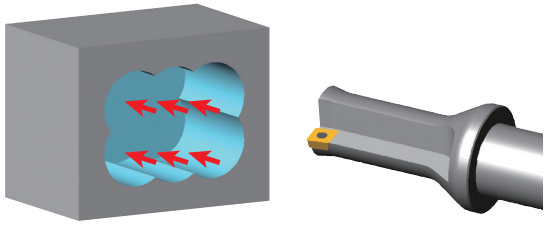


Keep the value of p_f for PCT type tools to less than 50% of the tool diameter (DC). For a_e, refer to the dimension under "a_e max" in the stock/dimensions table titled "Holders Max. Depth of Cut: 3D/5D".



■ Application Examples

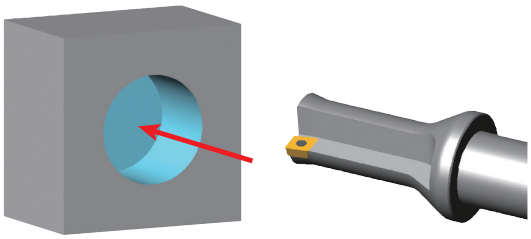
Pocketing PDL Type — Part Material: Titanium alloy



Tool : PDL400D2S40 (ø40)
Insert : WDXT125012-G
Grade : ACK300

Cutting Speed : v_c=131 SFM
Feed Rate : f=0.0027 IPR
(v_f=0.878 IPM)
Depth of Cut : a_e (p_i)=0.984"

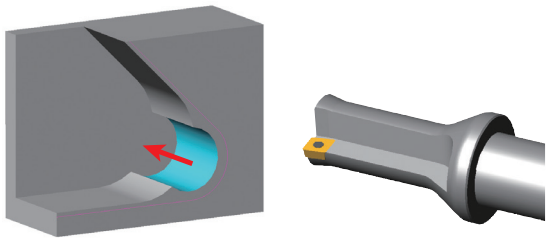
Drilling PDL Type — Part Material: 316 Stainless



Tool : PDL200D3S25 (ø20)
Insert : WDXT063006-G
Grade : ACP300

Cutting Speed : v_c=591 SFM
Feed Rate : f=0.0039 IPR
(v_f=11.26 IPM)
Depth of Cut : a_e (p_i)=0.787"

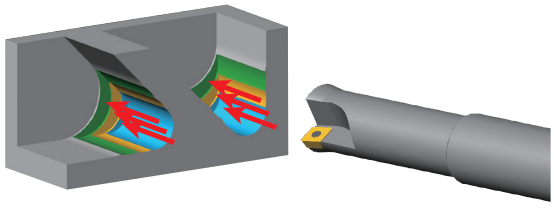
Corner Fillet Removal PDL Type — Part Material: 316 Stainless



Tool : PDL250D2S25 (ø25)
Insert : WDXT073506-G
Grade : ACP300

Cutting Speed : v_c=459
Feed Rate : f=0.0039 IPR
(v_f=7.008 IPM)
Depth of Cut : a_e(p_i)=0.590"

Corner Finishing PCT Type — Part Material: Titanium alloy

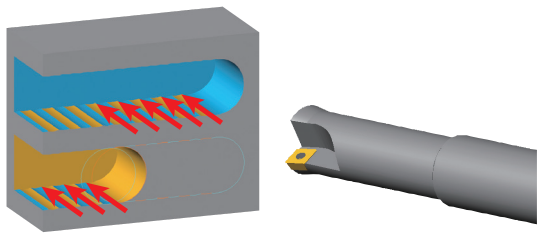


Tool :
PCT320D3S32 (ø32)
PCT250D3S25 (ø25)
PCT200D3S20 (ø20)
Grade : ACK300

Insert :
WDXT094008-G
WDXT073506-G
WDXT063006-G

Cutting Speed : v_c=164 SFM
Feed Rate : f_z=0.0016 ipt
(v_f=3.15 to 14.99 IPM)
Depth of Cut : a_e (p_i)=0.125 to 0.256"

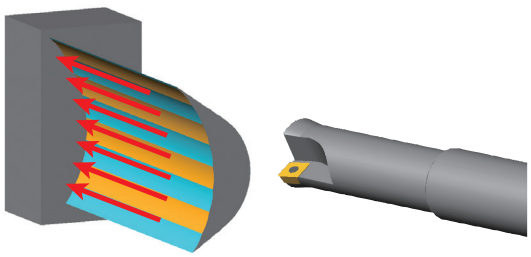
Groove Processing PCT Type — Part Material: Titanium alloy



Tool : PCT320D5S32 (ø32)
Insert : WDXT094008-G
Grade : ACK300

Cutting Speed : v_c=131 SFM
Feed Rate : f_z=0.0014 ipt
(v_f=2.205 IPM)
Depth of Cut : a_e (p_i)=0.197"

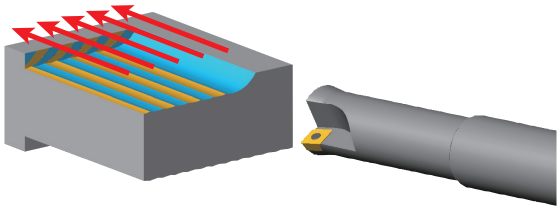
Contouring PCT Type — Part Material: Stainless Steel



Tool : PCT250D5S25 (ø25)
Insert : WDXT073506-G
Grade : ACP300

Cutting Speed : v_c 492 SFM
Feed Rate : f_z=0.002 ipt
(v_f=15.039 IPM)
Depth of Cut : a_e=0.118"

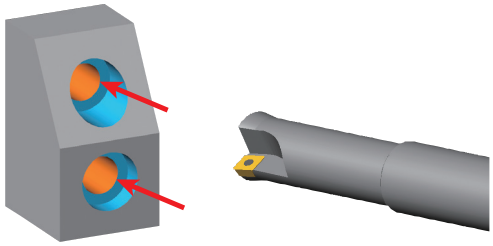
Shoulder Plunging PCT Type — Part Material: 304 Stainless



Tool : PCT320D3S32 (ø32)
Insert : WDXT094008-G
Grade : ACP300

Cutting Speed : v_c=591 SFM
Feed Rate : f_z=0.003 ipt
(v_f=21.14 IPM)
Depth of Cut : a_e=0.276
p_i=0.197

Counterboring PCT Type — Part Material: Cr-Mo Steel



Tool : PCT200D5S20 (ø20)
Insert : WDXT063006-G
Grade : ACP300

Cutting Speed : v_c=492 SFM
Feed Rate : f_z=0.003 ipt
(v_f=28.19 IPM)
Depth of Cut : a_e=0.138"

For the P and K grades for which ACP300 and ACK300 inserts are the first recommendation, ACP100 inserts are the second recommendation.
In this case, it is recommended to set the cutting speed (V_c) to 130% and the feed rate (*f*) to 75% of the figures in the table above.

For the P and K grades for which ACP300 and ACK300 inserts are the first recommendation, ACP100 inserts are the second recommendation.
In this case, it is recommended to set the cutting speed (V_c) to 130% and the feed rate (f_z) to 75% of the figures in the table above.

MEMO

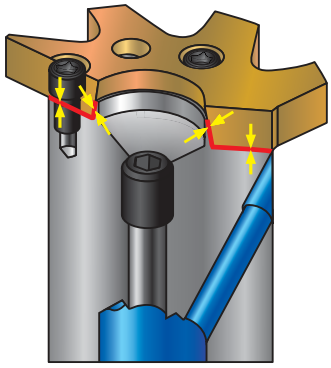
■ Features

●Achieving high efficiency through high speed and high feed capabilities!
(v_c=164 to 1,640 SFM, f=0.016" to 0.047" IPR)

- Compatible with a wide range of cutting conditions, allowing management of cutting conditions and coolant supply
- Designed with minimal cutting edge length, eliminating galling and blemishes for improved quality and reliability
- Adoption of indexable cutting edge design improves reliability of quality and tool life, eliminating variability in tool life among reground inserts
- Cutting edge diameters from ø7.6 to ø140.6 mm available

●Easy insert replacement

●Flexible tool overhang lengths possible by combining the modular extension/arbor and shank with insert runout adjustment mechanism



A taper supports the insert on two faces (based on the HSK standard) for repeatability within 4 µm using random inserts

Small SumiReamer SR Type Insert Identification

Specifying Inserts Using Workpiece Hole Diameter Tolerance

The actual desired reamer diameter will be on the upper limit side of the median work tolerance, and will differ depending on diameter/tolerance range/grade. Contact Sumitomo Engineering Dept. for more details.

SR (1) S (2) G (3) 18.2 (4) + 20 - 10 (5) - A01 (6) - F05 (7) 12R 1 (8)

(1) SR Type	(5) Tolerance (µm) +/- or standard (e.g. H7)
(2) Small	(6) Approach Angle Code
(3) G = Straight, L = Lefthand helix	(7) Grade Symbol
(4) Workpiece Bore Diameter (mm)	(8) Coating Code

Specifying Inserts Using Desired Reamer Diameter

By adding a "Q" after the diameter, it is possible to specify exact desired reamer dimensions. Uncoated types are available within ±2µ, thin-coated layer types are available within ±3µ and thick-coated layer types are available within ±4µ.

SR (1) S (2) L (3) 18.2 (4) Q + 3 - 3 (5) - A01 (6) - F05 (7) 12R 1 (8)

(1) SR Type	(5) Tolerance (µm) +/-(6) Approach Angle Code
(2) Small	(7) Grade Symbol
(3) G = Straight, L = Lefthand helix	(8) Coating Code
(4) Median Desired Cutting Edge Diameter (mm)	

Small Holder

· Single insert screw improves insert replacement efficiency
· Capable of high-torque (high-load) machining

Ordering Method : For the catalog number, please indicate F05 (PVD grade) or T12 (Coated Cermet) in the □□□ when ordering. (e.g. SRG12.0H7-A01-F0512R1).
(It is also possible to order uncoated cermet/DLC grades.)

*Actual reamer diameter is near the upper limit of H7 tolerance.

SumiReamer SR Type Insert Identification

Specifying Inserts Using Workpiece Hole Diameter Tolerance

The actual desired reamer diameter will be on the upper limit side of the median work tolerance, and will differ depending on diameter/tolerance range/grade. Contact Sumitomo Engineering Department for more details.

SR (1) G (2) 18.2 (3) + 20 - 10 (4) - A01 (5) - F05 (6) 12R 1 (7)

(1) SR Type	(5) Approach Angle Code
(2) G = Straight, L = Lefthand helix	(6) Grade Symbol
(3) Workpiece Bore Diameter (mm)	(7) Coating Code
(4) Tolerance (μm) +/- or standard (e.g. H7)	

Specifying Inserts Using Desired Reamer Diameter

By adding a "Q" after the diameter, it is possible to specify exact desired reamer dimensions. Uncoated types are available within ±2μ, thin-coated layer types are available within ±3μ and thick-coated layer types are available within ±4μ.

SR (1) L (2) 18.2 (3) Q + 3 - 3 (4) - A01 (5) - F05 (6) 12R 1 (7)

(1) SR Type	(5) Approach Angle Code
(2) G = Straight, L = Lefthand helix	(6) Grade Symbol
(3) Median Desired Cutting Edge Diameter (mm)	(7) Coating Code
(4) Tolerance (μm) +/-

N·m Recommended Tightening Torque (N·m)

■ SR Type Usage Instructions (Adjusting Runout)

The runout at the cutting edge of a reamer should be zero to obtain optimum boring precision. To correct runout in the holder or the machine's spindle, use of holders with a runout adjustment mechanism, hydro chucks and shrink-fitting is recommended. Various methods can be used to measure runout on a SumiReamer SR type reamer. With good runout repeatability, it is recommended that inserts be replaced without removing the shank holder from the spindle.

● Runout Adjustment

Procedure:

1. Secure central clamping screw according to value "A" in the table (if no value is listed use value "B").
2. Load the tool into the machine spindle.
3. Set the indicator (with 1 µm / .0001 inch resolution) on the marked run out ① area on the shank.
4. Measure run-out of the two adjustment screw ② axes. Compensate half the value of the total run-out error by using the adjustment screws. Check run out on all four axis points and repeat the adjustment if necessary. Tighten all adjusting screws, and verify run-out of .005 mm / .0002"" T.I.R. or less.
5. Tighten the central clamping screw according to the value in table "B".
6. Check the run out again and readjust if necessary.

*A has the greatest runout accuracy, followed by B and then C.

For Reaming Diameters larger than 36.601 mm

Procedure

1. Secure central clamping screw according to value "A" in the table (if no value is listed use value "B").
2. Load the tool into the machine spindle.
3. Set the indicator (with 1 µm / .0001 inch resolution) on the marked run out area ① on the shank.
4. Measure run-out of the two adjustment screw ② axes.
   Compensate half the value of the total run-out error by using the adjustment screws. Check run out on all four axis points and repeat the adjustment if necessary. Tighten all adjusting screws, and verify run-out of .005 mm / .0002"" T.I.R. or less.
5. Tighten the central clamping screw according to the value in table "B".
6. Check the run out again and readjust if necessary.

■ Troubleshooting

Failure	Countermeasures
Enlarged Diameter 	· Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Decrease the cutting speed. · Increase the feed rate. · Increase the coolant concentration. · Reduce the stock removal. · Check the cutting edge for damage (whether there are built-up edges). · Change the reamer diameter.
Tapered Hole 	· Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Decrease the cutting speed. · Decrease the feed rate. · Adjust the coolant concentration. · Review the pre-machining process. · Review the clamping method of the workpiece. · Compare the hole diameters when the workpiece is clamped and when it is unclamped. · Check and correct the direction of chip evacuation.
Chatter marks on machined surface 	· Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Change the approach angle of the insert cutting edge. · Review the clamping method of the workpiece. · Decrease the cutting speed. · Increase the feed rate.
Poor Surface Roughness 	· Check the cutting edge for damage. · Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Check whether the cutting conditions are within the recommended range. · Change to internal coolant supply. · Increase the coolant concentration.

Failure	Countermeasures
Return Mark 	· Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Check the cutting edge for damage (whether there are built-up edges). · Reduce the stock removal. · Change to an insert with a sharper cutting edge shape. · Decrease the return (lifting) feed.
Irregular Cutting Noise 	· Decrease the coolant concentration. · Increase the stock removal. · Check the cutting edge for damage. · Change the approach angle of the insert cutting edge.
Small Work Diameter 	· Replace the insert. · Decrease the coolant concentration. · Increase the stock removal. · Increase the cutting speed. · Decrease the feed rate.

● Precautions for SD Type (Center Bolt Clamp Type)

This product can be used for both through-hole and stop-hole boring. However, the head of the center bolt protrudes from the end of the body, so ensure clearance by referring to the protrusion of the center bolt (LFA) shown in the dimension table.

Our Mission is to manufacture the highest quality tungsten carbide rod, by using the most modern production techniques available in the industry.

■ Features & Benefits

- All products manufactured in Japan
- Axismateria Ltd., subsidiary of Sumitomo Electric Hardmetal features two manufacturing facilities and a research & development location for carbide rod blanks.
- Only materials of highest quality are applied for production
- Incorporating the most advanced production facility available and unique manufacturing techniques, provides short delivery times and consistently high quality products
- We utilize the latest quality control and assurance systems
- We prioritize the advancement of high level research and development

■ Carbide Rod Grade Description

Class	Properties					Features	Products
	Grade	Grain Size (µm)	Cobalt Content (wt%)	TRS (GPa)	Hardness (HRA)		
Ultra- micro Grain	AF209	0.2	9.0	4.0	93.5	The finest micro-grain carbide	Ultra small size PCB Drills, drills, & endmills
	AF312	0.3	12.0	4.4	92.5	Very high toughness characteristics	Small size PCB drills
	AF310	0.3	10.0	4.1	93.0	High wear resistance with toughness	Small size PCB drills & routers
	AF308	0.3	8.0	3.8	93.6	High wear resistance ultra-micro grained	PCB drills & endmills for hardened steel
Micro Grain	AF513	0.5	13.0	4.2	91.4	Tough micro-grain carbide	Endmills, drills for fracture resistance & taps
	AF512	0.5	12.0	4.4	92.0	High wear resistance with added toughness	Endmills
	AF510	0.5	10.0	4.0	92.4	High wear resistance with added toughness	Endmills & drills for general purpose
	AF505	0.5	5.0	3.6	93.6	High wear resistance, micro-grain carbide	PCB drills & routers
Fine Grain	AF810	0.8	10.0	3.8	91.4	High wear resistance with added toughness	Endmills & drills
	AF806	0.8	6.0	3.5	93.0	High wear resistance at high speed machining	PCB drills
	AF805	0.8	5.0	3.3	93.2	High wear resistance, fine grain carbide	Endmills, drills for aluminum & reamers
	AF906	0.9	6.0	3.4	92.4	High toughness with average hardness	Endmills & drills for cast iron

Plate Blanks

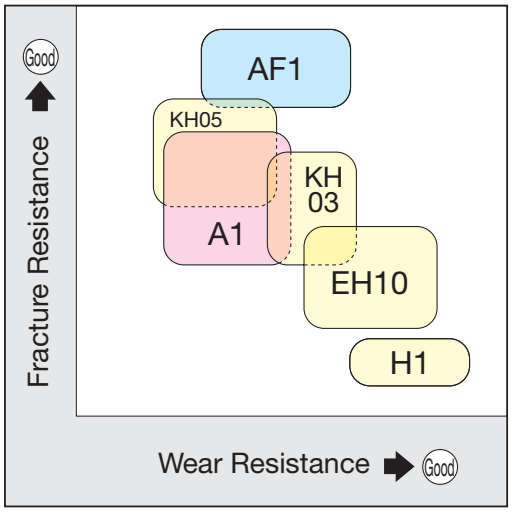
A comprehensive stocked range of grades in carbide plate blanks for mold and die materials, as well as carbide rods for drill or reamer materials.

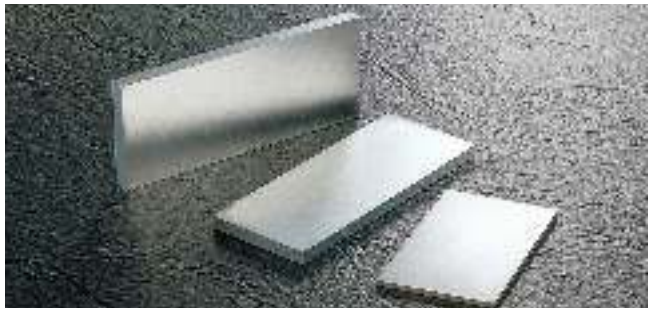
■ Grades

- AF1 Ultra-fine grained Carbide
  With grains finer than that of conventional grades, an excellent balance of high toughness and high hardness as well as superior edge sharpness is achieved.
- A1 Micro-fine Grained Carbide
  Micro-fine grained carbide A1 is a best-selling general purpose grade with high wear resistance and toughness.
- Micro-grained Carbide H1
  Reliable grade for machining non-ferrous metals.
- Basic Carbide EH10
  Highly evaluated grade for general machining of cast iron and exotic alloys. Perfect for drills and reamers.
- KH Series
  · KH03: Has strength (transverse rupture strength) and hardness similar to A1, with greatly improved chipping resistance that is comparable to ultra-fine grained grades.
  · KH05: With a higher cemented carbide binder content than KH03, this grade has even greater strength (transverse rupture strength) and chipping resistance.

■ Properties and Applications

Grade	Hardness		Transverse Rupture Strength	Applications	
	HRA	HV(GPa)	TRS(GPa)		
A1	91.4	15.6	3.2	Endmills	IT Mold Punches
AF1	92.5	17.3	4.4	Small Drills	
KH03	91.4	15.2	3.3	Molds / Dies	
KH05	90.4	13.6	3.5		
EH10	92.4	17.3	3.4	Drills, Reamers	
H1	92.9	17.7	2.1		





Ultra-fine grained carbide (AF1) is specially developed for the manufacturing of carbide mold parts (punches) with a variety of sizes in stock.

Rod Blanks

Rod Blanks grades ideal for applications such as endmills, drills and reamers where edge strength, toughness and wear resistance are essential.

- All Sintered surface
- Available Grades: AF312, AF513, AF805, AF906, AF308, AF510
- Special grades & 330 mm length available upon request

■ General Features

Sintered CBN - SUMIBORON®, which has CBN (cubic boron nitride) is a hard material second only to diamond - as its main component. CBN is sintered with a special ceramic binder under ultra-high pressure and temperature.
CBN - SUMIBORON® has high hardness, excellent thermal resistance and excellent properties including being unreactive to ferrous metals, enabling exotic alloys, hardened steel or hard cast iron to be machined. Excellent efficiency and longer tool life can also be achieved from high-speed finishing of cast iron.
Sumitomo's CBN - SUMIBORON® was first successfully developed in Japan by our company in 1977. Coated CBN - SUMIBORON® with a special ceramic coating, and binderless CBN made by directly bonding CBN particles without a binder are new additions to our product lineup.

■ Features

Sintered CBN - SUMIBORON® is mainly used for the machining of ferrous metals due to its low chemical reactivity with iron. There are 4 different classifications of CBN -SUMIBORON® as follows:

- Table (A) below shows the group with a high CBN content, where each grain is fused together. This group can be used for the machining of abrasive materials like cast iron, heat-resistant alloys and powdered metals.
- Table (B) shows the group where CBN grains are held together by a special ceramic binder with a strong binding force. These provide excellent wear resistance and toughness in the machining of hardened steel and cast iron.
- Table (C) below shows CBN - SUMIBORON® with a special ceramic coating. The CBN and coating layer exhibit the hardness, toughness, thermal resistance and oxidation resistance requird for optimal cutting performance.
- Table (D) shows a product containing no binder; its structure of directly bonded nano or to sub-micron CBN particles provides excellent hardness and thermal conductivity, making it highly efficient with a long tool life when machining exotic alloys such as titanium alloys and cobalt-chrome alloys.

■ Classifications / Applications

	Classifications	Structure	Diagram	Grade	Part Material
(A)	Mainly CBN grains fused together			BN700 BN7000 BN7500 BNS800	K Cast Iron (FC) Sintered Alloy Powdered Metal S Exotic Alloy Sintered Alloy Powdered Metal K Cast Iron (FC) S Exotic Alloy

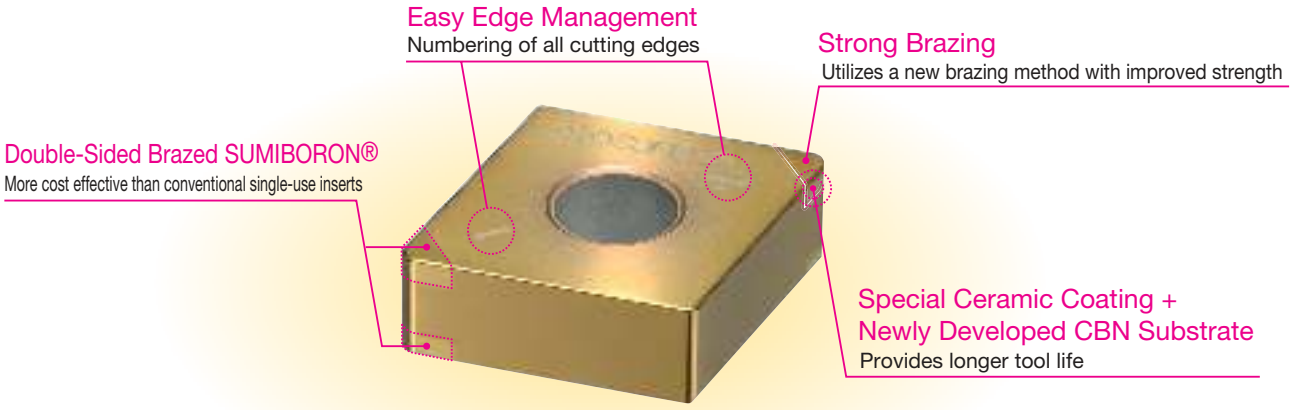
Coated CBN - SUMIBORON® Series

Achieves higher speed, higher efficiency and higher precision

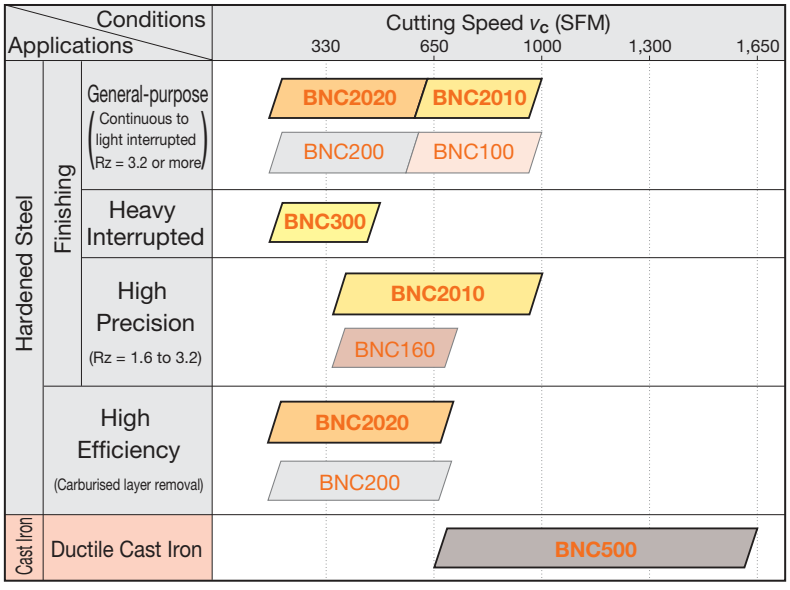
■ General Features

With a highly thermal-resistant and tough CBN substrate coupled with a special ceramic coating, this series caters to a wide variety of applications, with improved precision and longer tool life compared to conventional CBN.
Our extensive range, including more cost-effective, double-sided, multi-cornered one-use inserts, offers a selection of economical and easy-to-use tools.
The Coated CBN - SUMIBORON® edge specifications have been further enhanced to exhibit higher accuracy machining and burr control performance.

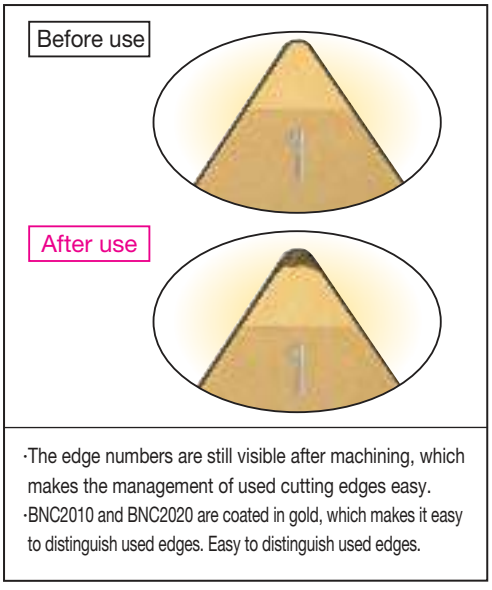
■ Features



■ Application Range



■ Cutting Edge Management



·The edge numbers are still visible after machining, which makes the management of used cutting edges easy.
·BNC2010 and BNC2020 are coated in gold, which makes it easy to distinguish used edges. Easy to distinguish used edges.

HARDENED STEEL MACHINING

● Advantages of CBN - SUMIBORON for hardened steel cutting

Below is an analysis of the use of CBN compared to grinding. In terms of cost, not only is the investment involved for introducing new machinery reduced, it is possible to shorten the processing cycle time by finishing complicated shapes in one run. In terms of quality, machining with a single chuck is possible, improving machining accuracy and squareness. Furthermore, dry machining is possible, with various advantages such as better global environmental conservation and resource recycling. The workpieces shown in the table to the lower right have shapes more likely to benefit from being cut, especially compared to grinding.

	Advantages	Remarks
Cost	Facility investment is low	· Cheaper machines · Reduced processes · Improved machining efficiency with less machining required
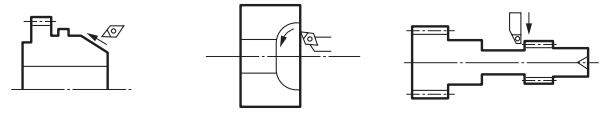
	Complex finishing in a single set-up	Quality	Improved precision	Environment	Environmentally-friendly	Sludge management → Chip control (Recyclable)

Machining Versatility with CBN



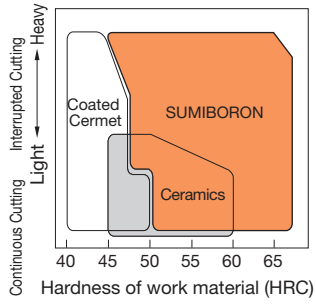
Recommended Grade

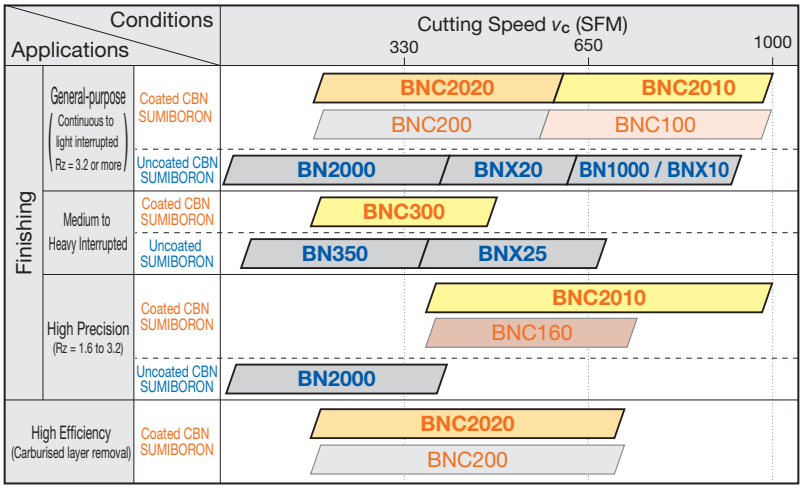
	Grade	Binder	CBN Content (%)	Grain Size (μm)	Hardness HV (GPa)	Transverse Rupture Strength (GPa)	Main Coating Components	Coating Thickness (μm)	Features
Coated	BNC2010	TiCN	50 to 55	2	30 to 32	1.1 to 1.2	TiCN Multiple Layers	1.5	Improves the wear resistance of coating and substrate and stably achieves excellent surface roughness.
	BNC2020	TiN	70 to 75	5	34 to 36	1.4 to 1.5	TiAlN Multiple Layers	1.5	Combination of a tough substrate with a wear-resistant and adhesive coating layer to achieve general purpose to high-efficiency machining with long tool life
	BNC300	TiN	60 to 65	1	33 to 35	1.5 to 1.6	TiAlN	1	Suitable for finishing work materials combining continuous and interrupted cutting.
	BNC100	TiN	40 to 45	1	29 to 32	1.0 to 1.1	TiAlN / TiCN	2	Suitable for high-speed finishing thanks to highly wear-resistant coating.
	BNC160	TiN	60 to 65	3	31 to 33	1.2 to 1.3	TiAlN / TiCN	2	Achieves stable, high-precision finishing of hardened steel.
	BNC200	TiN	65 to 70	4	33 to 35	1.4 to 1.5	TiAlN	2	Provides long tool life thanks to a tough substrate and highly wear-resistant coating.
Uncoated	BN1000	TiCN	40 to 45	1	27 to 31	0.9 to 1.0	—	—	Achieves ultimate wear and fracture resistance. Suitable for high-speed cutting.
	BN2000	TiN	50 to 55	2	31 to 34	1.1 to 1.2	—	—	General-purpose grade for hardened steel machining with a high degree of fracture and wear resistance.
	BNX20	TiN	55 to 60	3	31 to 33	1.0 to 1.1	—	—	Achieves excellent crater wear resistance. Suitable for high-efficiency cutting under high-temperature conditions.
	BN350	TiN	60 to 65	1	33 to 35	1.5 to 1.6	—	—	Achieves ultimate cutting edge strength. Suitable for heavy interrupted cutting.
	BNX10	TiCN	40 to 45	3	27 to 31	0.9 to 1.0	—	—	Excellent wear resistance. Suited to continuous high-speed cutting.
	BNX25	TiN	65 to 70	4	29 to 31	1.0 to 1.1	—	—	Exhibits superior fracture resistance in high-speed cutting. Suitable for high-speed interrupted cutting of hardened steel.

Transverse rupture strength measured with test piece equivalent to insert CBN layer.

Application Range

● Hardened Steel Machining

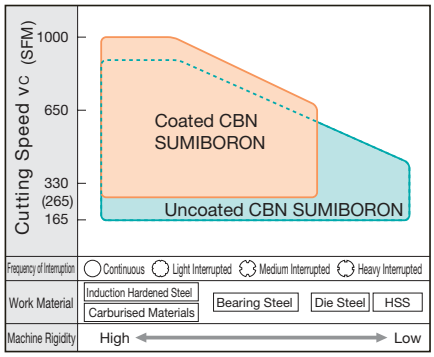




Applications

Coated CBN - SUMIBORON: 1st recommendation for hardened steel machining, excellent performance in high-speed, high-efficiency machining.
Uncoated CBN - SUMIBORON: Optimal for machining small items with a limited cutting speed & hardened steel.

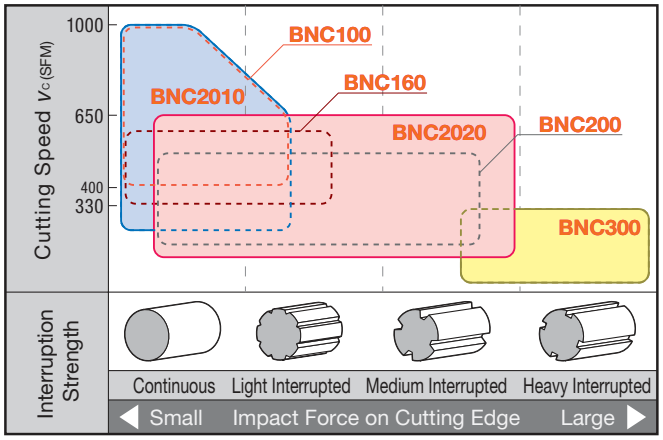
Series	Applications
Coated CBN SUMIBORON	· First recommendation for hardened steel machining · Machining requiring high speed and high accuracy · Machining requiring high efficiency, such as carburised layer removal
Uncoated CBN SUMIBORON	· Machining where cutting speed cannot be increased, such as small product machining · Machining of workpieces containing hard particles such as mold components · Machining with low tool rigidity



Application Range

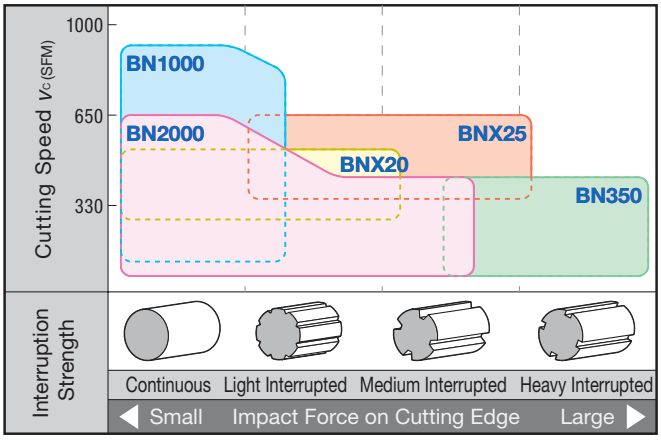
● Induction Hardened Steel (S45C/S55C, etc.), Carburized Steel

Coated CBN - SUMIBORON



● Induction Hardened Steel (S45C/S55C, etc.), Carburized Steel

Uncoated CBN - SUMIBORON



● Die Steel (D2 Tool Steel, etc.), High Speed Steel

Uncoated CBN - SUMIBORON

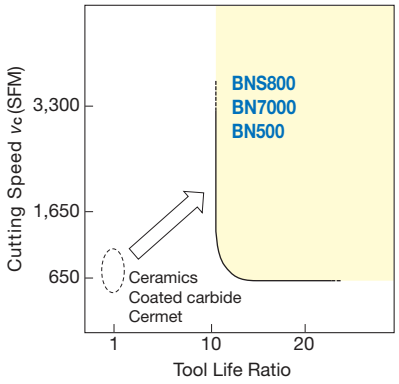
CAST IRON MACHINING

- Advantages of machining cast iron with CBN - SUMIBORON

Compared with conventional tools, a longer tool life for high speed machining is acheived. In addition, machining efficiency is improved along with consistently better wear resistance, a sharper edge, excellent surface roughness and dimensional tolerance. CBN - SUMIBORON is ideal for finishing of gray cast iron and ductile cast iron and heat-treated high-grade cast iron such as ADI.

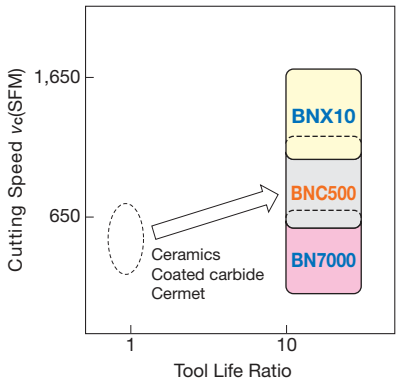
High-speed Machining

- Gray Cast Iron

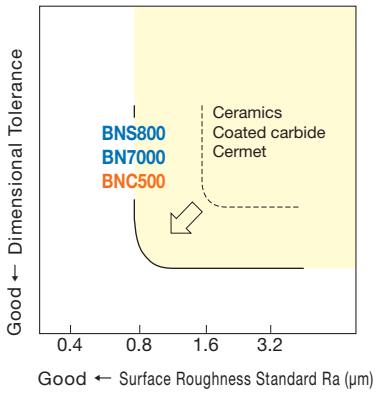


High-speed Machining

- Ductile Cast Iron



High-precision Machining



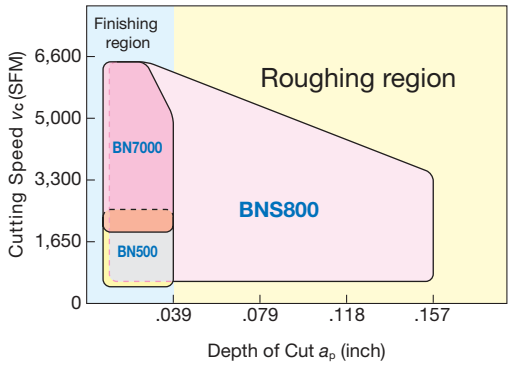
Recommended Grade

	Grade	Binder	CBN Content (%)	Grain Size (μm)	Hardness HV (GPa)	Transverse Rupture Strength (GPa)	Main Coating Components	Coating Thickness (μm)	Features
Uncoated	BNS800	Al Alloy	85 to 90	8	39 to 42	0.9 to 1.1	—	—	100% solid CBN structure and excellent thermal shock resistance.
Uncoated	BN7000	Co Compound	90 to 95	2	41 to 44	1.8 to 1.9	—	—	Exhibits wear and fracture resistance in cutting of cast iron and exotic alloys.
Uncoated	BN500	TiC	65 to 70	6	32 to 34	1.0 to 1.1	—	—	Grade optimised for cast iron cutting. Provides superior wear and fracture resistance.
Coated	BNC500 (For Ductile Cast Iron)	TiC	60 to 65	4	32 to 34	1.1 to 1.2	TiAlN	2	Suitable for machining of hard-to-cut cast iron thanks to the highly wear-resistant substrate and coating.

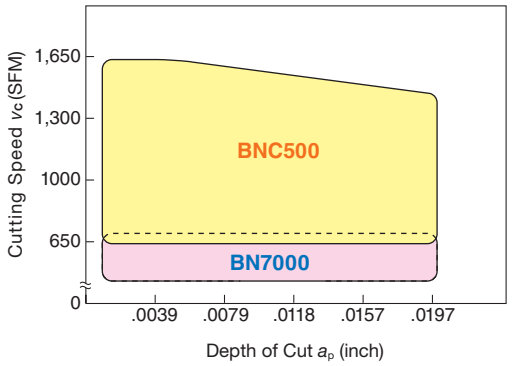
Transverse rupture strength measured with test piece equivalent to insert CBN layer.
Refer to pages L9 and L10 for machining of sintered components, rolls, hard facing alloys and heat-resistant alloys.

Application Range

- Gray Cast Iron



- Ductile Cast Iron



- Special Cast Iron

Part Material	Hardness (HB)	Part Material Structure	Examples	Cutting Speed v_c (SFM) 330 650 1000 1,150 1,300 1,650

SINTERED COMPONENT MACHINING

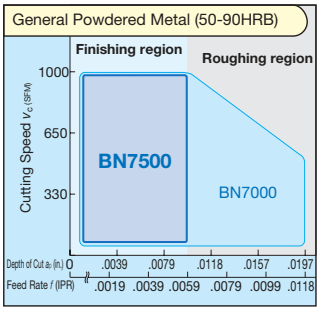
● Advantages of cutting sintered components with CBN - SUMIBORON

CBN - SUMIBORON has much smaller edge wear than carbide or cermet, and also has better wear resistance and can form a sharp edge easily. CBN - SUMIBORON is able to prevent burrs and chipping on the edges of the workpiece, achieving good machining precision and surface roughness.

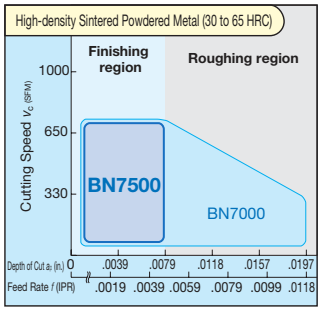
Sintered Components

Recommended Grade

● General Powdered Metal



● High-Density/Sintered Powdered Metal

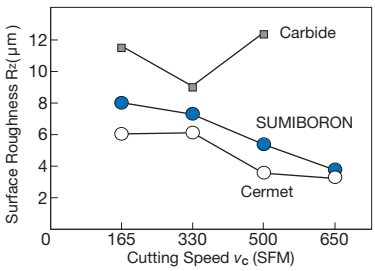


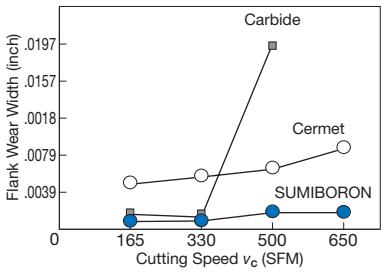
Grade	Binder	CBN Content (%)	Grain Size (µm)	Hardness HV (GPa)	Transverse Rupture Strength (GPa)	Main Coating Components	Coating Thickness (µm)	Features
BN7500	Co Compound	90 to 95	1	41 to 44	2.0 to 2.1	—	—	Maintains ultimate cutting edge sharpness. Suitable for finishing of powdered metal.
BN7000	Co Compound	90 to 95	2	41 to 44	1.8 to 1.9	—	—	Grade exhibiting improved wear and fracture resistance in roughing of sintered materials.

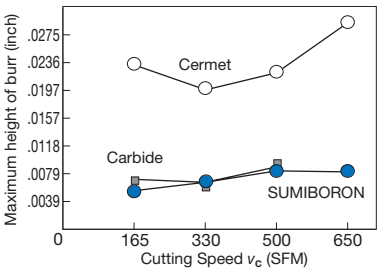
Transverse rupture strength measured with test piece equivalent to insert CBN layer

Performance

● Grade Performance Comparison







Work Material: SMF4040 equivalent
Machining Details: ø80-ø100 heavy interrupted facing with grooves and drilled holes (after 40 passes)
Tool Cat. No.: TNGA331
Cutting Conditions: f = .0039 IPR, a_p = .0039" Wet

For general powdered metal, carbide and cermet grades can perform up to v_c = 330 SFM. However, around v_c =400 SFM, wear becomes rapid and surface roughness deteriorates with increased burrs. On the other hand, CBN (SUMIBORON) exhibits stability and superior wear resistance, burr prevention and surface roughness, especially at high speeds.

Valve Seat Ring (VSR)

*VSR has both (Intake: IN) and (Exhaust: EX) with the exhaust generally being hardened.

Recommended Grade

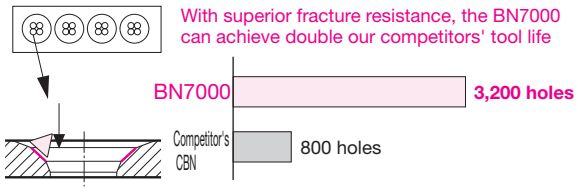
● Recommended Grade by Machining Details

	Gasoline VSR material	Diesel VSR material
Plunge cut	BN7000 BN7500 / BN350	BN7000 BN7500 / BN350
Traverse cut	BN7000 BN7500 / BN500	BN7000 BN7500 / BN500
Workpiece Hardness (HV)	Low ◄ 300HV ► High	Low ◄ 300HV ► High

Recommended Cutting Conditions

Cutting Speed v_c(SFM)	Feed Rate f (IPR)	Depth of Cut a_p(inch)
165 to 415	.0012 to .0079	.0020 to .0197

Application Examples



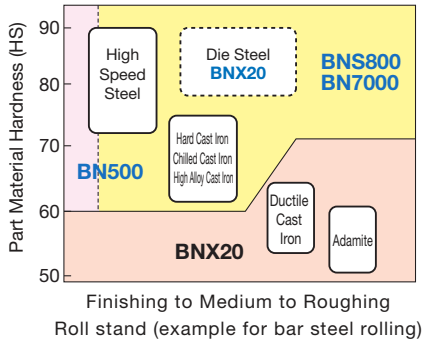
Part Material: Powdered Metal (150 to 250 HV)
Machining Details: VSR(IN) 45° Surface Finishing
Tool Cat. No.: TBGN521B
Cutting Conditions: v_c=330 SFM, f = .0031 IPR Wet

ROLL MACHINING

● Advantages of roll machining with CBN - SUMIBORON

CBN - SUMIBORON enables the machining of high-hardness rolls that were previously difficult to machine with conventional tools, drastically improving machining efficiency.

Recommended Grade



Finishing to Medium to Roughing
Roll stand (example for bar steel rolling)

Recommended Cutting Conditions

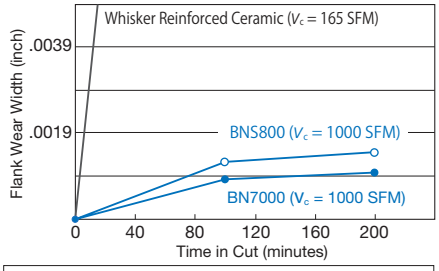
Part Material		Recommended Cutting Conditions		
Category	Hardness (HS)	Cutting Speed v_c (SFM) 65 130 200 265 330 400 465	Feed Rate f (IPR)	Depth of Cut a_p (Inch)
Adamite	≥ 40		.0039 - .0197	.0079 - .1181
Chilled cast iron	≥ 60		.0039 - .0197	.0079 - .1181
High-alloy cast iron	≥ 60		.0039 - .0197	.0079 - .1181
HSS	≥ 70		.0039 - .0157	.0039 - .1181

HARD FACING ALLOY MACHINING

● Advantages of hard facing alloy machining with CBN - SUMIBORON

CBN - SUMIBORON enables the machining of high-hardness facing alloys that were previously difficult to machine with conventional tools, drastically improving machining efficiency. The first recommended grade is BN7000, followed by BNS800.

Performance



Work Material: Colmonoy No.6 (NiCr-Based Self-Fluxing Alloy)
Tool Cat. No.: SNG322
Cutting Conditions: f = 0.0039 IPR, a_p = .0079" Dry

● BN7000 has a long tool life and minimal wear with high speed cutting

Recommended Cutting Conditions

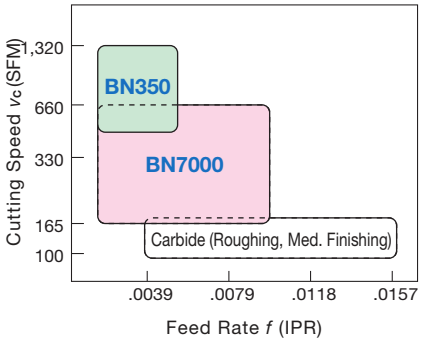
Part Material		Recommended Cutting Conditions		
Category	Material	Cutting Speed v_c (SFM) 165 330 660 1000	Feed Rate f (IPR)	Depth of Cut a_p (inch)
Ni-Based Self-Fluxing Alloy	Colmonoy No.6		.0019 - .0079	.0039 - .1181
Co-Based Self-Fluxing Alloy	Stellite		.0019 - .0079	.0039 - .0394

HEAT-RESISTANT ALLOY MACHINING

● Advantages of heat-resistant alloy machining with CBN - SUMIBORON

CBN - SUMIBORON provides long tool life in the finishing of heat-resistant alloys.

Recommended Grade



Recommended Cutting Conditions

Part Material		Recommended Cutting Conditions		
Category	Material	Cutting Speed v_c (SFM) 165 330 500 660	Feed Rate f (IPR)	Depth of Cut a_p (Inch)
Ni-Based Heat-Resistant Alloy	Inconel 718		.0019 - .0079	.0039 - .0394
Co-Based Heat-Resistant Alloy	Stellite		.0019 - .0079	.0039 - .0394

● CBN - SUMIBORON is ideal for finishing heat-resistant alloys.

TITANIUM ALLOY CUTTING

- Advantages of titanium alloy machining with SUMIBORON

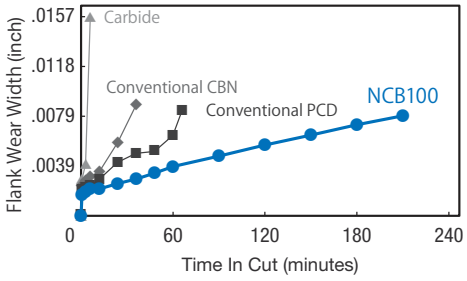
CBN (SUMIBORON) enables high speed machining of titanium alloys that were previously difficult to machine with conventional tools, drastically improving machining efficiency.

Recommended Grade

Grade	Binder	CBN Content (%)	Grain Size (μm)	Hardness HV (GPa)	Transverse Rupture Strength (GPa)	Main Coating Components	Coating Thickness (μm)	Features
NCB100	—	100	0.2 to 0.5	51 to 54	1.8 to 1.9	—	—	Ideal for high-efficiency finishing of titanium alloy.

Transverse rupture strength measured with test piece equivalent to insert CBN layer

Performance



Work Material: Titanium Alloy (Ti-6Al-4V)
Tool Cat. No.: CNGA432
Cutting Conditions: V_C = 500 SFM, f = 0.0059 IPR, a_p = .0197"
Wet (High Pressure Coolant)

Recommended Cutting Conditions

Part Material		Grade	Recommended Cutting Conditions Min. - Max.		
Composition	Hardness (HRC)		Cutting Speed v_c (SFM) 165 330 500 660 825 1000	Feed Rate f (IPR)	Depth of Cut a_p (inch)

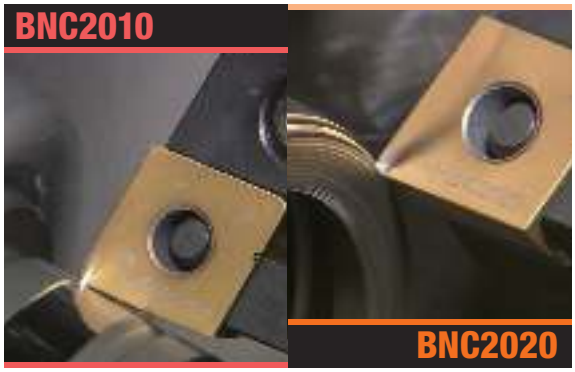
BNC2010 / BNC2020



Longer Tool Life and Cost Reduction

■ General Features

Provides improved machining accuracy and longer tool life compared to conventional Coated CBN - SUMIBORON by combining newly developed CBN substrate and ceramic coating.
Exhibits excellent performance in high-precision and general cutting of hardened steel and enables reductions in machining costs.

■ Features

● BNC2010

· Grade for high-precision finishing requiring good surface roughness and dimensional tolerance.
Ideal for high-precision machining thanks to excellent wear resistance.

· Further maintains excellent surface roughness.
Maintains excellent surface roughness thanks to coating with high notch wear resistance and CBN substrate.

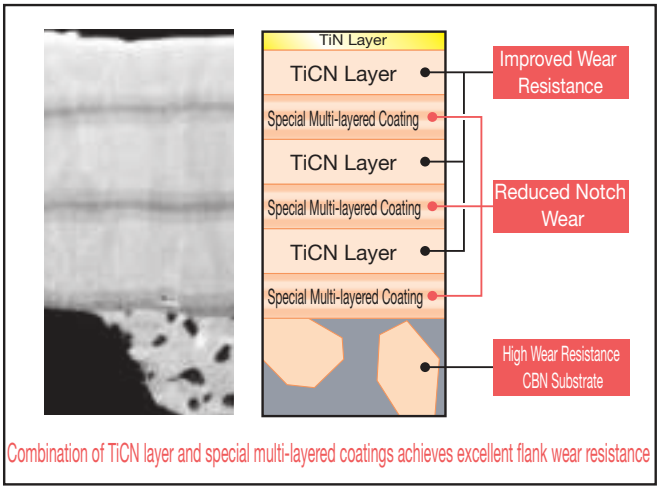
● BNC2020

· General-purpose grade suitable for typical hardened steel machining applications.
Achieves further stability in machining of a wide range of hardened steel components.

· Achieves long tool life thanks to highly wear-resistant, highly adhesive coating and tough CBN substrate.
Achieves long, stable tool life even in high-efficiency and interrupted machining.

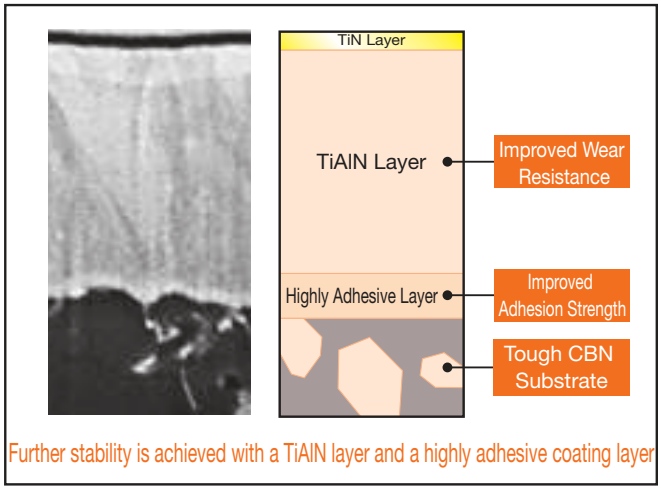
■ CBN Substrate and Coating Structure of BNC2010 and BNC2020

BNC2010



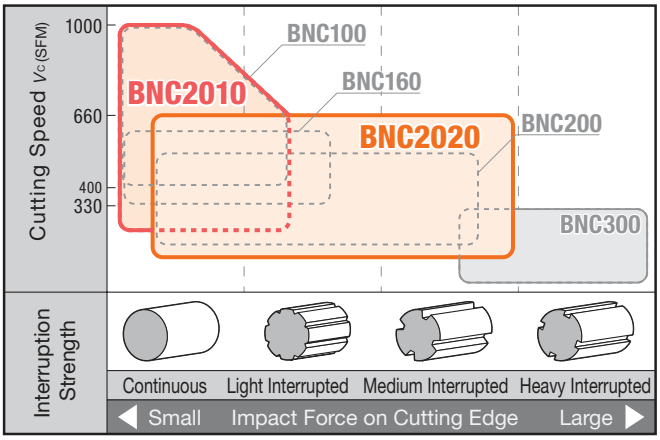
Combination of TiCN layer and special multi-layered coatings achieves excellent flank wear resistance

BNC2020



Further stability is achieved with a TiAlN layer and a highly adhesive coating layer

■ Application Range



■ Recommended Cutting Conditions

● BNC2010

Cutting Speed v_c (SFM)	
400 150 660 250 1000	
Feed Rate f (IPR)	Depth of Cut a_p (inch)
.0012 - .0098	.0012 - .0138

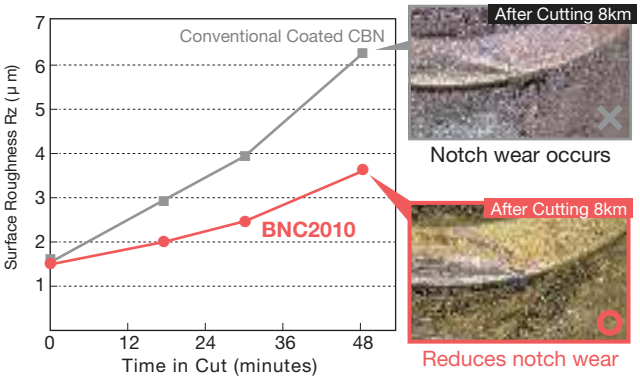
● BNC2020

Cutting Speed v_c (SFM)	
165 330 500 660 730	
Feed Rate f (IPR)	Depth of Cut a_p (inch)
.0012 - .0157	.0012 - .0197

Cutting Oil: Continuous Cutting Dry, Wet
Interrupted Cutting Dry

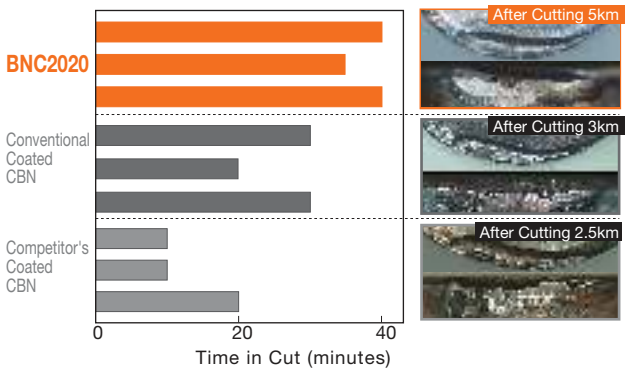
■ Cutting Performance

● BNC2010



Part Material: Low Carbon Alloy Steel 58-62HRC (Continuous)
Tool Cat. No.: 4NC-DNGA432 Cutting Edge Treatment: S01225
Cutting Conditions: v_c = 530 SFM, f = .0031 IPR, a_p = .0039" Wet

● BNC2020



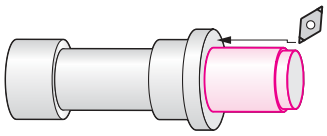
Part Material: 15CrMo Alloy Structural Steel 58-62HRC (Interrupted Cutting)
Tool Cat. No.: 4NC-CNGA433 Cutting Edge Treatment: S01225
Cutting Conditions: v_c = 430 SFM, f = .0039 IPR, a_p = .0236" Dry

■ Application Examples

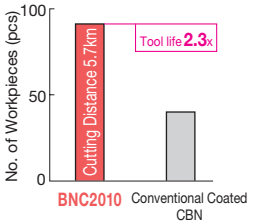
BNC2010

[Continuous External Turning of Main Shaft] (58 to 60 HRC)

BNC2010 provides excellent wear resistance and achieves excellent surface roughness.



Surface Roughness Ra = 0.6μm

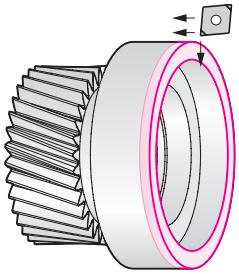


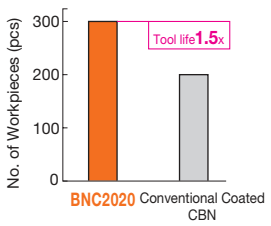
Tool Cat. No.: 4NC-DNGA432 (BNC2010)
Cutting Conditions: v_c = 660 SFM, f = .0039 IPR, a_p = .0138" Dry

BNC2020

[Carburised Layer Removal for Sun Gear] (58 to 60 HRC)

BNC2020 achieves long tool life in high load cutting.

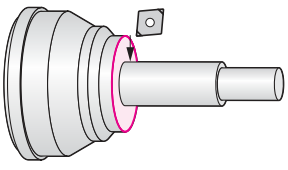




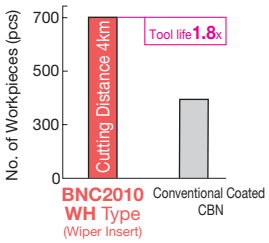
Tool Cat. No.: 4NC-CNGA432 (BNC2020)
Cutting Conditions: v_c = 330 SFM, f = .0059 IPR, a_p = .0197" Wet

[Facing of CVJ Outer Race] (58 to 60 HRC)

BNC2010 with a WH type wiper insert maintains excellent surface roughness for a long time.



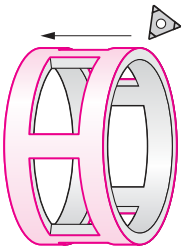
Surface Roughness Rz = 1.6μm

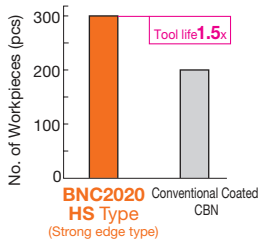


Tool Cat. No.: 4NC-CNGA433WH (BNC2010)
Cutting Conditions: v_c = 500 SFM, f = .0079 IPR, a_p = .0079" Dry

[Interrupted Machining of CVJ Cage Window] (58 to 60 HRC)

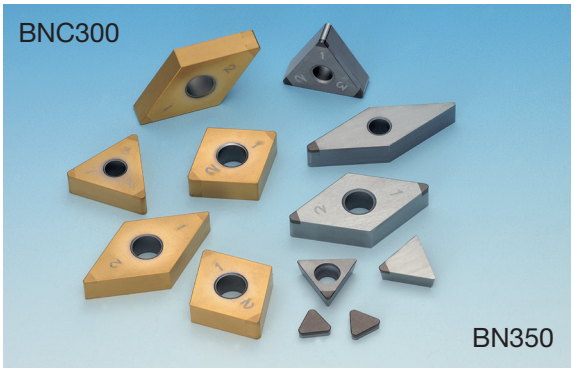
BNC2020 strong edge HS type provides stable performance in interrupted cutting.





Tool Cat. No.: 6NC-TNGA333HS (BNC2020)
Cutting Conditions: v_c = 400 SFM, f = .0039 IPR, a_p = .0059" Dry

The Ultimate in Interrupted Cutting of Hardened Steel



■ General Features

BNC300

A CBN substrate that emphasizes toughness is coupled with a highly wear-resistant TiAlN-based coating layer that has improved adhesion strength. With a good balance of fracture and wear resistance, this grade achieves a long, stable tool life in interrupted cutting or in a mixture of continuous and interrupted cutting.

BN350

CBN - SUMIBORON with the highest fracture resistance and toughest CBN. Reliable grade for achieving stable tool life in heavy interrupted cutting conditions.

■ Features

●BNC300

· Long, stable tool life in interrupted cutting
Achieving long, stable tool life in heavy interrupted cutting, with superior fracture resistance.

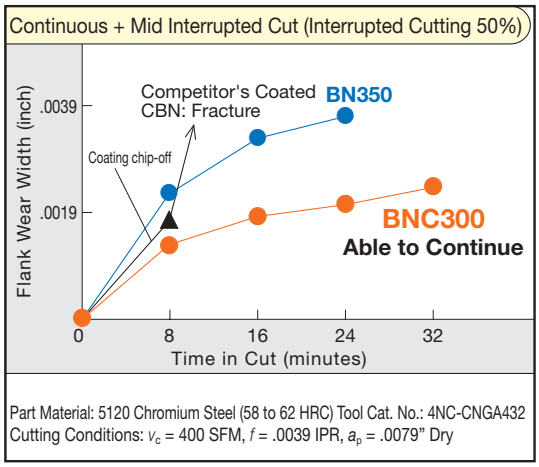
· Superior dimensional tolerance
TiAlN-based high-wear-resistance coating with good adhesion strength. Achieves superior dimensional tolerance even in interrupted cutting.

· Supports various work material shapes
Achieves long, stable tool life even in workpieces requiring both continuous and interrupted cutting.

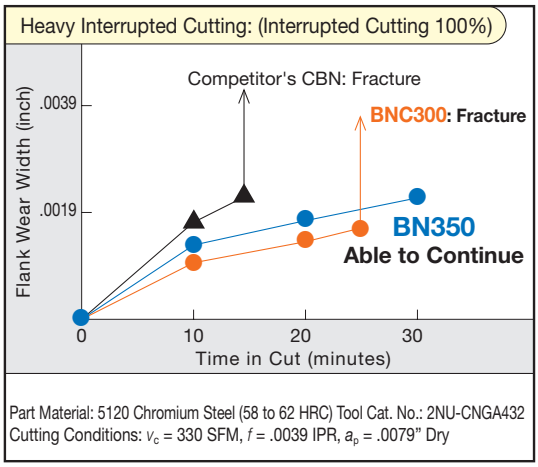
●BN350

· Superb stability with regard to fracture
Superior fracture resistance, preventing the fractures that commonly occur during interrupted cutting. Achieves a long, stable tool life.

■ Cutting Performance



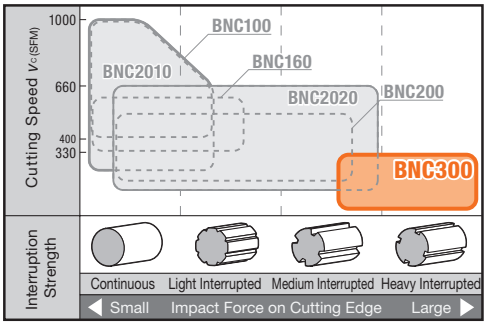
● **BNC300** has a superior balance of fracture and wear resistance.



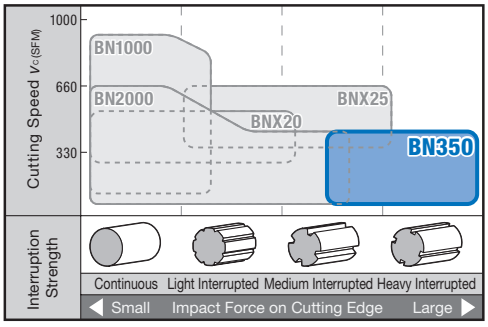
● **BN350** exhibits very good fracture resistance.

■ Application Range

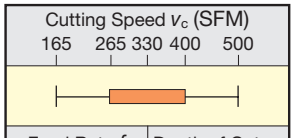
• Coated CBN (SUMIBORON)



• CBN (SUMIBORON)



■ Recommended Cutting Conditions (BNC300/BN350 common)

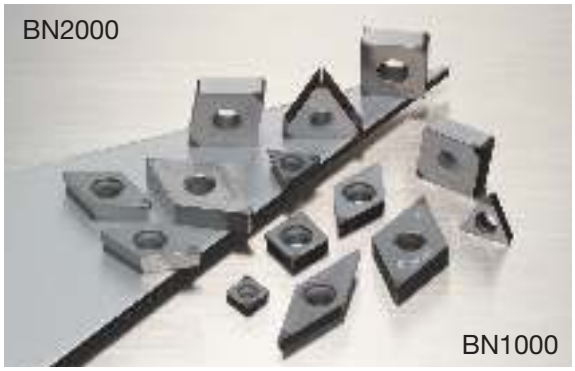


Feed Rate f (IPR)	Depth of Cut a_p (inch)
.0012 - .0079	.0012 - .0118

Coolant: Dry

MEMO

BN1000 / BN2000



■ General Features

Uncoated CBN - SUMIBORON grades that have a newly developed high-purity ceramic binder applied to them. Both fracture and wear resistance are combined to achieve a stable tool life in a wide variety of hardened steel machining.
We offer a wide selection of tools starting with single-cornered types.

■ Features

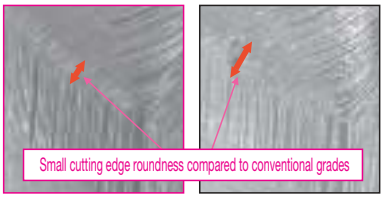
● BN1000

- **CBN - SUMIBORON grade for high-speed machining with the best wear resistance,** providing superior tool life in continuous cutting to light interrupted cutting.
- **Improved fracture resistance while also emphasizing wear resistance**
  Improved hardness and thermal resistance from the high-purity TiCN ceramic binder.

● BN2000

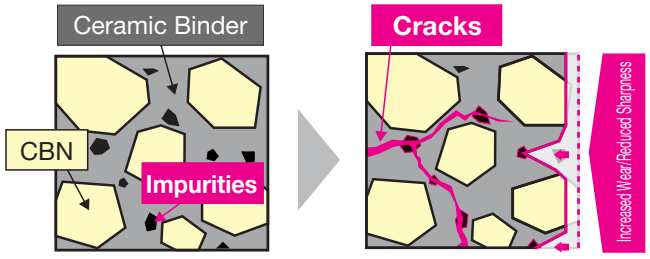
- **General-purpose grade suitable for typical hardened steel machining applications**
  Provides stable tool life in everything from continuous cutting to light to medium interrupted cutting.
- **Has a high degree of both fracture and wear resistance**
  Significant improvements in the performance of both by employing a high-purity ceramic binder.
- **Stable surface roughness achieved by increasing edge sharpness (right figure)**

Sharpness Comparison



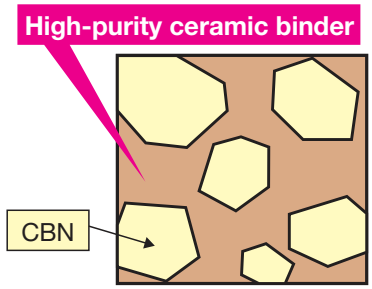
■ Newly Developed High-Purity Ceramic Binder

Conventional Grade



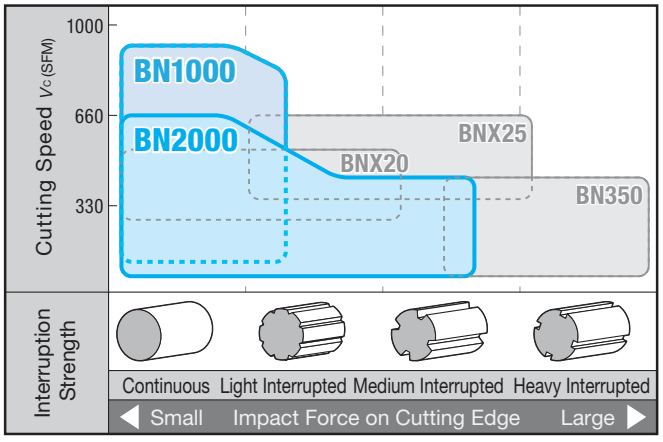
The impurities contained in the ceramic binder for conventional grades decrease the sintered body strength and thermal resistance, leading to cracks (breakage) and wear.

BN1000 / BN2000



With a newly developed high-purity ceramic binder, BN1000 / BN2000 achieve toughness and improved thermal resistance by decreasing impurities to an extreme.

■ Application Range



■ Recommended Cutting Conditions

● BN1000

Cutting Speed V_c (SFM)

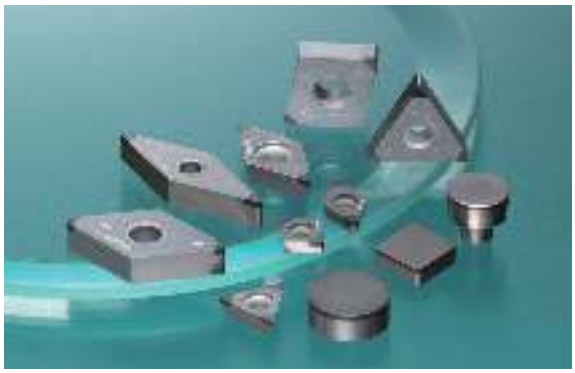
BN7000

K Cast Iron | Sintered Alloy

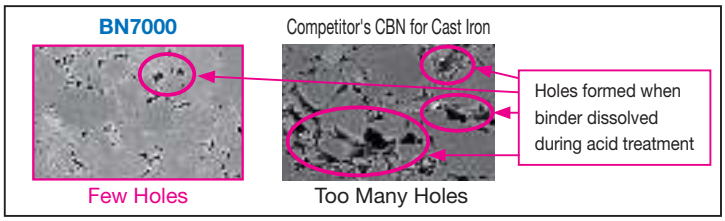
For high-speed finishing of cast iron, powdered metals and exotic alloys



■ General Features

Medium-grain CBN sintered to a high density to achieve the maximum content percentage.
Also delivers superior fracture resistance by increasing the bonding strength between CBN particles. Provides long, stable tool life for high-speed finishing work with cast iron, powdered metals and exotic alloys.

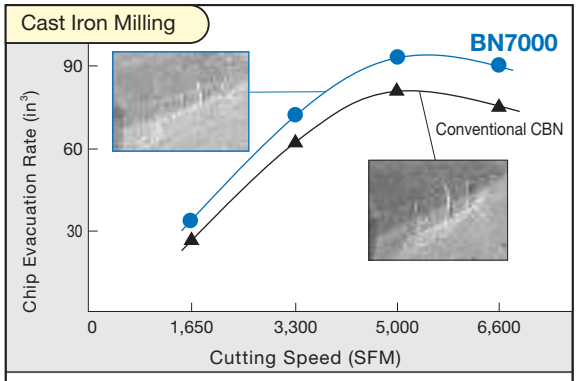
Acid-treated CBN Sintered Body Structure



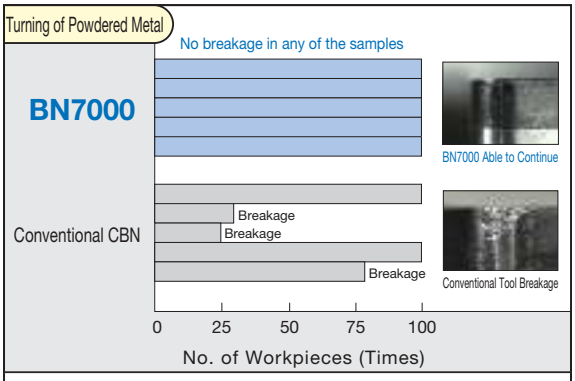
■ Features

- Excellent for high-speed finishing of cast iron
  Excellent fracture resistance and reduced occurrence of thermal cracking in high speed machining of gray cast iron.
- High-efficiency machining of powdered metal
  Standard + 2 different types of edge treatment, achieving long, stable tool life in machining of powdered metal of any shape or hardness.
- Able to machine any exotic alloy
  Exhibits high performance for the machining of exotic alloys such as rolls, HSS, heat-resistant alloys, etc.

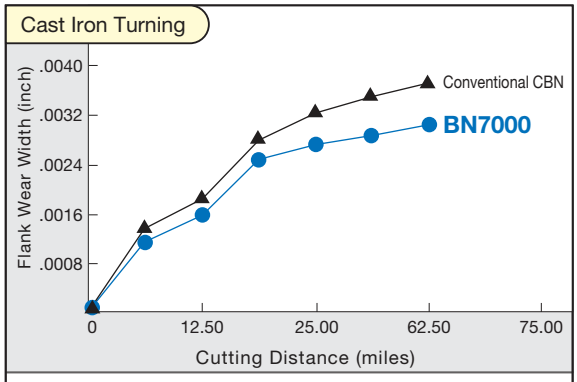
■ Cutting Performance



Part Material: Grey Cast Iron (Pearlite)
Tool Cat. No.: FMU4100R SNEW1203ADTR
Cutting Conditions: v_c =1650 - 6,600 SFM, f = .0079 IPR, a_p = .00118" Dry



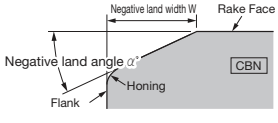
Work Material: SMF4040 (70HRB, Interrupted Cutting)
Tool Cat. No.: 2NU-CNGA432
Cutting Conditions: v_c = 825 SFM, f = .0039 IPR, a_p = .0118" Dry



Work Material: FC300 (Pearlite)
Tool Cat. No.: 2NU-CNGA432
Cutting Conditions: v_c = 2,650 SFM, f = .0059 IPR, a_p = .0079" Wet

■ Recommended Cutting Edge Treatment

	α	W	Honing
Standard	15°	.12 mm	No
LF Type	Sharp Edge		No
HS Type	25°	.12 mm	Yes



BN7500

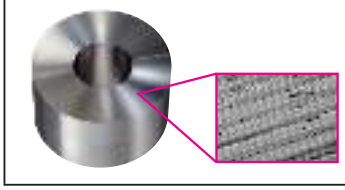
Sintered Alloy

Achieves high-precision, high-efficiency machining of powdered metal

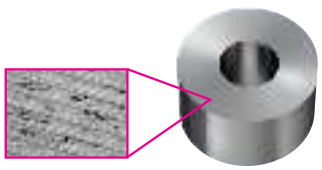
■ General Features

High-density sintered micro-grained CBN grains provide good sharpness and wear resistance to produce an excellent machined face surface on powdered metals during finishing. Excellent sharpness and wear resistance for high-quality machined surfaces in powdered metal finishing.

Surface finish using the BN7500



Surface finish using previous CBN



- The previous CBN left white blemishes on the machined surface, whereas the BN7500 leaves a better, glossy surface finish

■ Features

- Excellent for finishing of powdered metal

  Excellent machined surface quality and surface roughness.

- Available with 5 different types of edge treatment for machining sintered parts of any shape or hardness

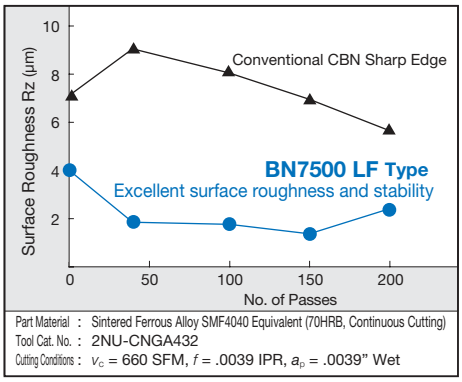
  LF has a sharper edge designed specifically for machining powdered metal with minimal burr and improved machining precision.

  HS has a strengthened cutting edge for stable chipping resistance during interrupted cutting and finishing.

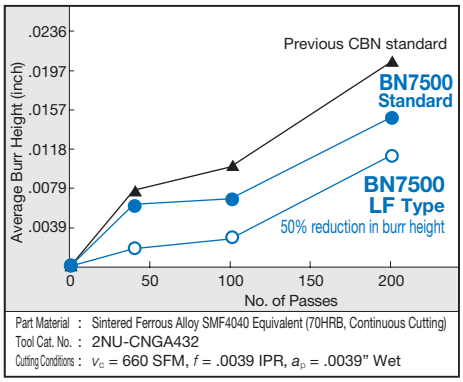
  Provides machining stability by reducing the variation in early milling surface roughness with the type emphasizing LE surface roughness.

  LS has an excellent balance of fracture resistance and sharpness, and supports finishing that includes light interrupted cutting.

■ Cutting Performance

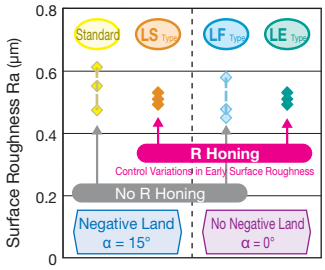


Part Material : Sintered Ferrous Alloy SMF4040 Equivalent (70HRB, Continuous Cutting)
Tool Cat. No. : 2NU-CNGA432
Cutting Conditions : v_c = 660 SFM, f = .0039 IPR, a_p = .0039" Wet



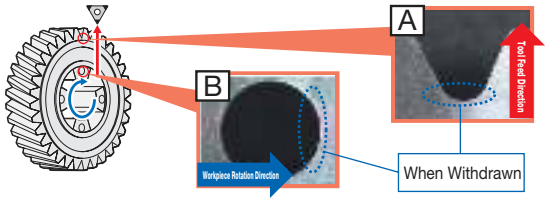
Part Material : Sintered Ferrous Alloy SMF4040 Equivalent (70HRB, Continuous Cutting)
Tool Cat. No. : 2NU-CNGA432
Cutting Conditions : v_c = 660 SFM, f = .0039 IPR, a_p = .0039" Wet

● Finished Surface Roughness during Initial Machining



Able to control early surface roughness variations by applying R honing to the cutting edge.

● Feed and Burr Relationship



- The LF type without R honing has a cutting edge sharpness superior to the LE type with R honing and can control burrs better.
- For a feed rate of .0039 IPR or higher, the LS type has a cutting edge sharpness superior to the standard type and can control burrs better.

	LF Type	LE Type	LS Type	Standard

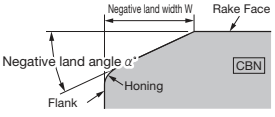
LF	α°= 0°		
LE	(No Negative Land)		Yes
LS	15°	.07 mm	
HS	25°	.05 mm	



BNS800

From finishing to roughing of cast iron and exotic alloys

■ General Features

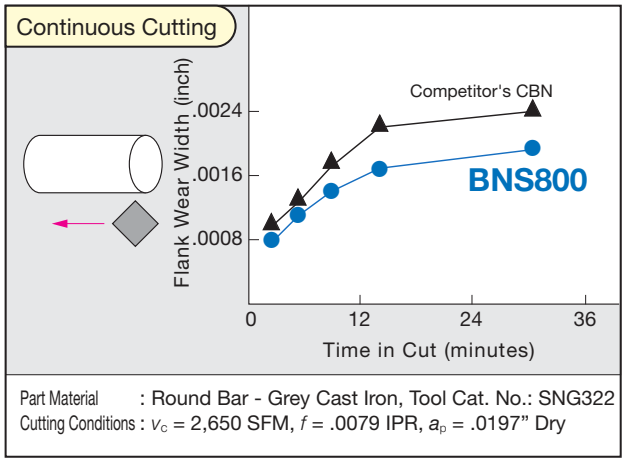
Enables great reductions in machining costs with a dedicated grade combining wear resistance and fracture resistance, and solid structure allowing the whole insert to be used as a cutting edge. Unlike conventional brazed type inserts, which are not suitable for high speed cutting and roughing, this grade can be used even for high-speed finishing processes.
Additionally, the RM type cutter is designed exclusively for Solid CBN - SUMIBORON and is suitable for high-speed rough milling.

■ Features

- Larger cutting depths
  100% solid CBN structure where the whole cutting edge length can be used.
- Supports high-precision finishing
  Grade with excellent balance of wear resistance and fracture resistance.
- Achieves overall cost reductions
  All corners of the insert can be utilized for greater economy.

BNS800 Dedicated Tool Holder ☞ L100 to L102
BNS800 Dedicated Cutter ☞ L121

■ Cutting Performance



Part Material : Round Bar - Grey Cast Iron, Tool Cat. No.: SNG322

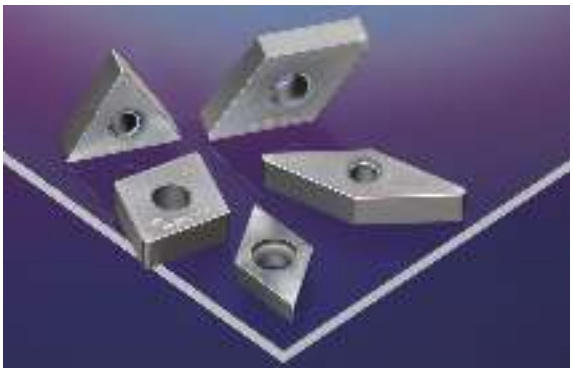
Coated CBN grades for ductile cast iron machining

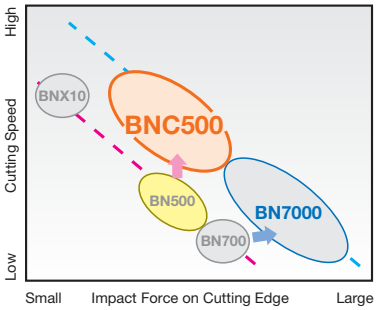


■ General Features

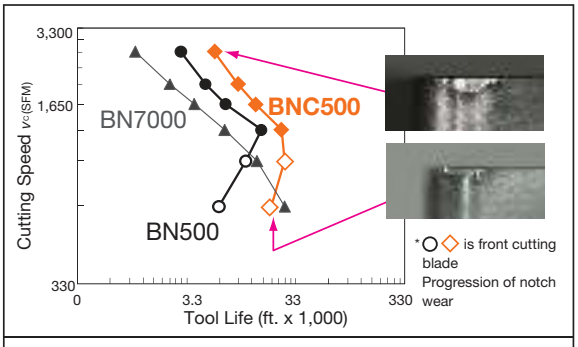
Broad improvements in the toughness of the CBN substrate and wear resistance through the use of a newly developed high-purity TiC binder. In addition, it demonstrates exceptional wear resistance by combining a ceramic coating with excellent thermal resistance. High-speed, high-precision machining is achieved when finishing ductile cast iron. It also provides a long, stable tool life for machining high-strength ductile cast iron, special cast irons such as vermicular cast iron and centrifugally-cast cast iron.

■ Features

- Stable tool life for high-speed machining of ductile cast iron
  Superior wear resistance, making stable machining possible under high-speed conditions.
- Supports high-precision machining
  Can maintain excellent dimensional tolerance and surface roughness over many hours.

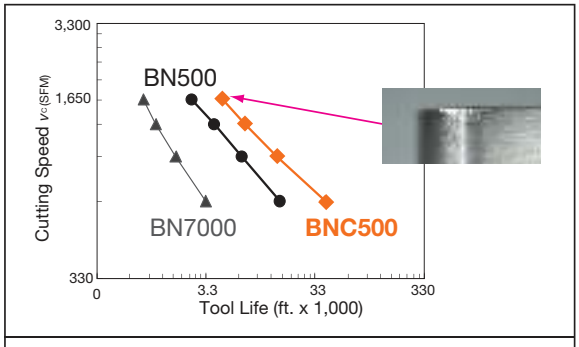


● Cast Iron Continuous Cutting (V-T Chart)



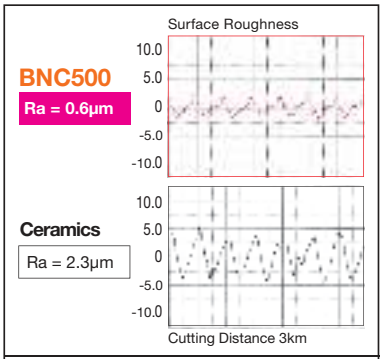
Part Material: Ductile Cast Iron (160HB) Tool Cat. No.: 4NC-CNGA432
Cutting Conditions: f = .0079 IPR, a_p = .0079" Wet
Tool Life Criterion: $V_B$max. = .0079"

● Ductile Cast Iron Continuous Cutting (V-T Chart)



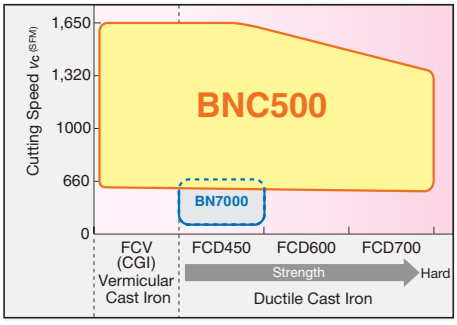
Part Material: 100-70-03 Cast Iron (260HB) Tool Cat. No.: 4NC-CNGA432
Cutting Conditions: f = .0079 IPR, a_p = .0079" Wet
Tool Life Criterion: $V_B$max. = .0079"

■ Machined Surface Quality

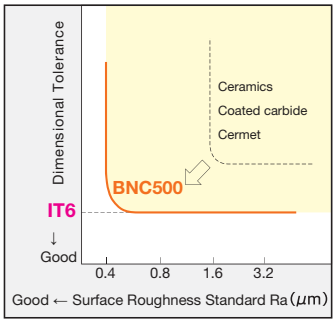


Part Material: Ductile Cast Iron FCD700 (260HB)
Cutting Conditions: V_C=1,320 SFM, f =.0039 IPR
a_p=.0039" Wet

■ Application Range



■ High-Precision Machining



■ Recommended Cutting Conditions

Cutting Speed V_c (SFM)			
660	1,000	1,320	1,650

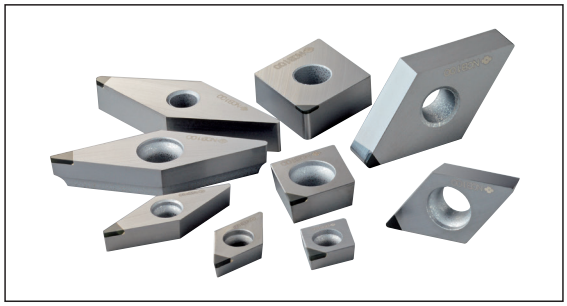
Nano-Polycrystalline CBN

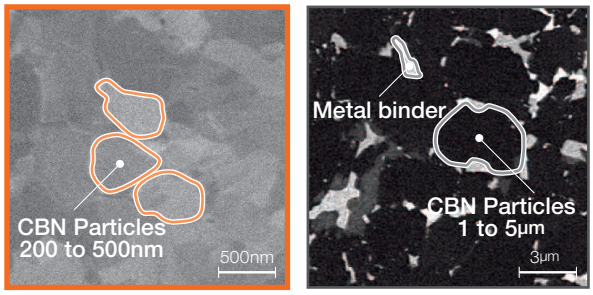
New



■ General Features

Binderless CBN, which does not contain any binders, is a CBN sintered product with directly and strongly bonded nano- to sub-micron CBN particles.
Compared to conventional CBN grades, this provides high hardness and thermal conductivity, making it highly efficient with a long tool life when machining exotic alloys such as titanium alloys and cobalt-chrome alloys.

■ Sintered Composition (SEM Image)



SUMIBORON Binderless　Conventional CBN

■ Physical Values

	SUMIBORON Binderless	Conventional CBN
CBN Content (vol%)	100	90 to 95
Binder	—	WC-Co
Hardness Hv (GPa)	51 to 54	41 to 44
Thermal Conductivity (W/m·K)	180 to 200	100 to 120

Binderless CBN NCB100

New

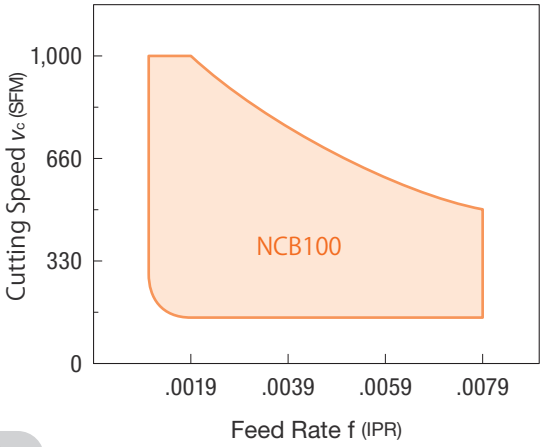
■ General Features

Adopts a nano-polycrystalline CBN sintered cutting edge with hardness and thermal conductivity significantly higher than conventional sintered CBN. Enables overwhelmingly longer tool life and improved efficiency and machining accuracy when machining exotic alloys such as titanium alloys or cobalt-chrome alloys.

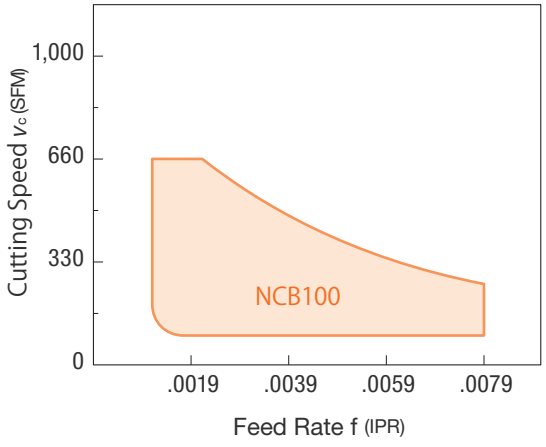
■ Features

- Ideal for high efficiency finishing of exotic alloys such as titanium alloys and cobalt-chrome alloys
  Exhibits outstanding wear resistance due to the excellent hardness and thermal conductivity of nano-polycrystalline CBN
- Excellent dimensional tolerance and machined surface roughness maintained for extended periods
  Tool replacement count can be drastically reduced compared to conventional grades, enabling work efficiency to be improved and total costs to be reduced

■ Application Range (Machining Titanium Alloy)

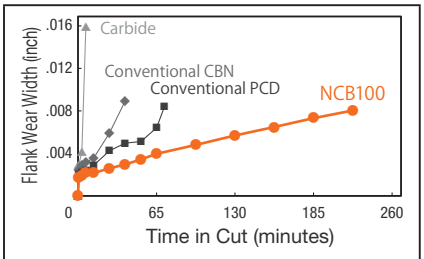


■ Application Range (Cobalt-chrome alloy machining)



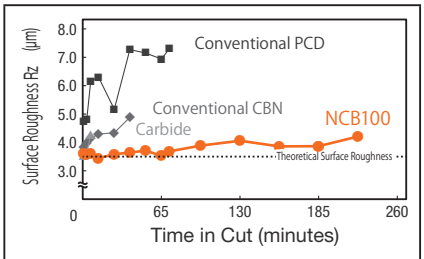
■ Cutting Performance (Machining Titanium Alloy)

● Wear Resistance

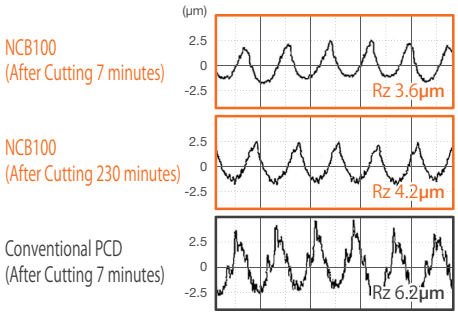


Part Material: Titanium Alloy (Ti-6Al-4V)
Tool Used: CNGA432
Cutting Conditions: V_c = 500 SFM, f = .0059 IPR
a_p = .0197" Wet (High Pressure Coolant)

● Machined Surface Roughness

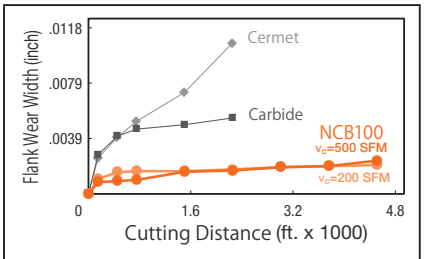


Part Material: Titanium Alloy (Ti-6Al-4V)
Tool Used: CNGA432
Cutting Conditions: V_c = 500 SFM, f = .0059 IPR
a_p = .0197" Wet (High Pressure Coolant)



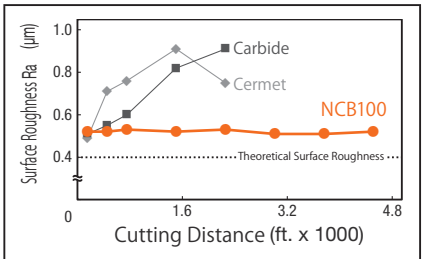
■ Cutting Performance (Machining Cobalt-chrome Alloy)

● Wear Resistance

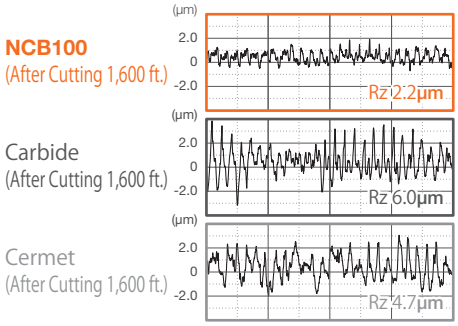


Part Material: Cobalt-chrome alloy (forging)
Tool: VNGA332
Cutting Conditions: V_c = 200, 500 SFM, f = .0039 IPR
a_p = .0157" Wet

● Machined Surface Roughness



Part Material: Cobalt-chrome alloy (forging)
Tool: VNGA332
Cutting Conditions: V_c = 200 SFM, f = .0039 IPR
a_p = .0157" Wet



■ Recommended Cutting Conditions

● Titanium Alloy

Part Material		Grade	Recommended Cutting Conditions Min. - Max.		
Composition	Hardness (HRC)		Cutting Speed v_c (SFM) 165 330 500 660 825 1000	Feed Rate f (IPR)	Depth of Cut a_p (inch)

N-FV N-LV N-SV	N-SV	Chipbreaker Type	

■ Cutting Performance (Machining Titanium Alloy)

One-Use Insert NU Type / NS Type

■ **Features**

- Affordable version of the previously expensive sintered CBN material, at its best size.
- One-use type eliminates regrinding, making tool management easy.
- Reduce required storage space with 10pcs pack.

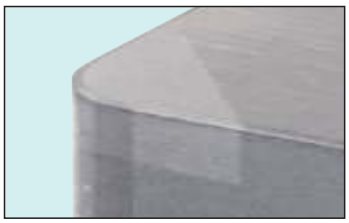
Multi-Cornered, One-Use Insert

■ **Features**

- Multiple SUMIBORON cutting edges are brazed onto one insert. Price per edge is lower than normal single-corner, single-use inserts.
- Coated SUMIBORON is available as a double-faced insert. Diamond type inserts have 4 cutting edges and triangular inserts have 6 cutting edges.
- Multi-cornered one-use type has G-class tolerance with side faces ground. In addition, all edges are numbered for easy cutting edge management.

One-Use Wiper Inserts

WG / WH Type



■ **Features**

- SUMIBORON single-use insert with wiper edge for hardened steel machining.
- Excellent surface roughness comparable to grinding.
- Improved machining efficiency is possible with higher speeds and feeds.
- Lineup of low feed WG types and high feed WH types.

One-Use Insert With Chipbreaker

Break Master FV Type / LV Type / SV Type

■ **Features**

- One-use SUMIBORON insert with chipbreaker. SV type is ideal for carburised layer removal, while LV and FV types are ideal for hardened steel machining.
- Chipbreaker incorporated on the CBN cutting edge to maintain chip control capabilities throughout the machining process.
- Unique chipbreaker design can be applied to both hardened and non-hardened parts with effective chip control.

Solid SUMIBORON

■ **Features**

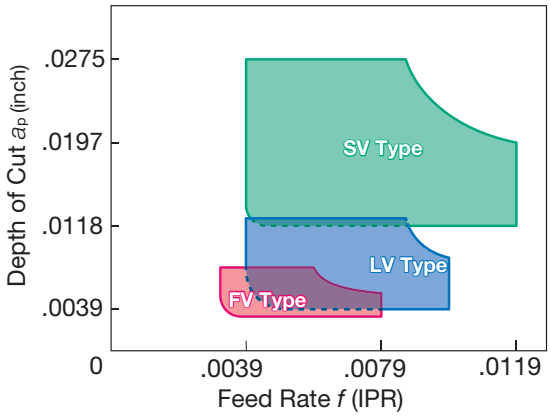
- BNS800 realizes a 100% solid CBN structure. With no brazed portion, this grade is excellent for the roughing of cast iron at large depths of cut.

FV / LV / SV

■ Features

- One-use CBN - SUMIBORON insert with chipbreaker. SV type is ideal for carburized layer removal, while FV and LV types are ideal for hardened steel machining.
- Chipbreaker incorporated on the CBN cutting edge to maintain chip control capabilities throughout the machining process.
- Unique chipbreaker design can be applied to both hardened and non-hardened parts with effective chip control.
- SV lineup includes Coated CBN - SUMIBORON BNC2010/ BNC160 for good wear resistance and BNC2020/BNC200, which enables high efficiency machining.
- FV and LV lineup include Coated CBN - SUMIBORON BNC2020/BNC200 for general purpose, BNC2010/BNC160 for good wear resistance and CBN - SUMIBORON BN2000 also for general purpose.

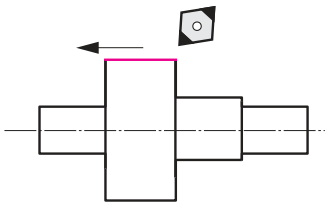
■ Application Range



*For hardened parts (above 50HRC), use a depth of cut below .0197".

■ Application Examples

External Carburized Layer Removal



· No constant stoppages or incorrect part dimension problems and the chips are small.
· Double the tool life of competitors' CBN.

Break Master SV

Tool Life = 200 pcs

BNC200 (No Breaker)

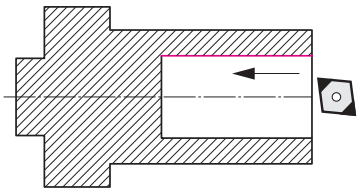
Tool Life = 200 pcs

Competitor CBN (with chipbreaker)

Tool Life = 100 pcs

Part Material: Low Alloy Steel Carburized Steel (Shaft)
Tool Cat. No.: 4NC-CNGG432SV (BNC200)
Cutting Conditions: v_c=500 SFM, f = .0059 IPR
a_p = .0197", 2 Passes Wet

Finishing of Hardened Steel



· Improved chip control for internal diameter machining

Break Master FV

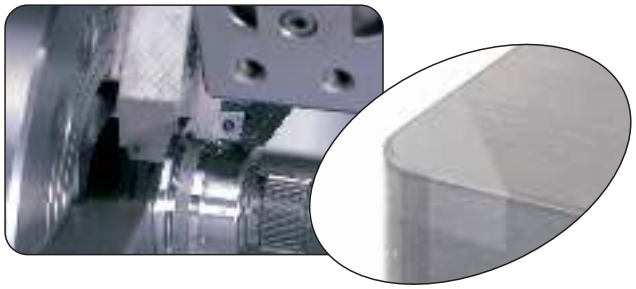
Tool Life = 300 pcs

BNC200 (No Breaker)

Tool Life = 300 pcs

Part Material: Carburized Steel 60HRC (Automotive Component)
Tool Cat. No.: 2NC-CCGT21.51FV (BNC200)
Cutting Conditions: v_c= 265 SFM, f = .0031 IPR
a_p= .0059" Wet

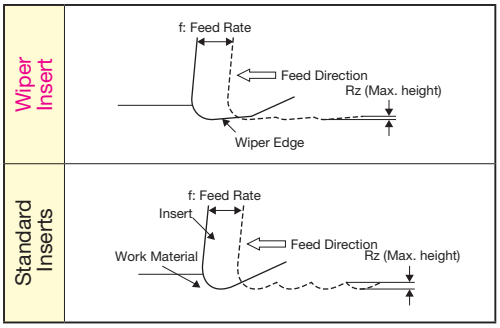
WG / WH



■ Features

- CBN - SUMIBORON single-use insert with wiper edge for hardened steel machining.
- Excellent surface roughness comparable to grinding.
- Improved machining efficiency with higher speeds and feeds.
- Lineup of standard feed: WG and high feed: WH.

■ Wiper Insert Operation



■ Wiper Insert Finished Surface Roughness

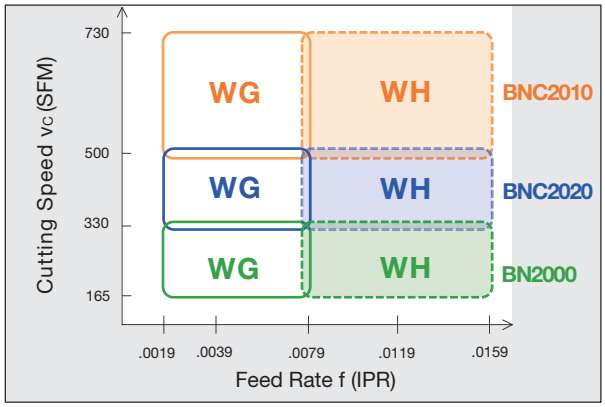
	Wiper Insert (WG / WH)		Standard Insert (No Wiper, .0313" Nose Radius)	
	Low Feed Machining (f= .0039 IPR)	High Feed Cutting (f= .0117)	Low Feed Machining (f= .0039 IPR)	High Feed Cutting (f= .0117)
Surface Roughness	WG	WH		
Surface Roughness Rz (Max. Height)	0.63µm	1.39µm	1.98µm	9.20µm

The wiper insert offers good finished surface roughness and improved machining efficiency.

■ Recommended Cutting Conditions

(Surface Roughness Standard 1.6s to 3.2s)

- For optimum effectiveness, use wiper inserts for continuous cutting. Note that a nose radius insert should be used for profiling.
- Chattering and undulation may occur. Use work material and machines with high rigidity.



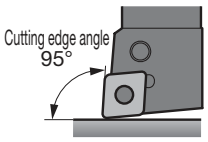
WG: Feed Rate f = .0079 IPR or Less Recommended (Finished Surface Roughness Rz = 1.6 to 3.2µm)
WH: Feed Rate f = .0079 IPR or More Recommended (Finished Surface Roughness Rz = 1.6 to 3.2µm)
Lineup of 5 grades to suit each cutting speed (BN2000, BNC2010, BNC2020, BNC200, BNC160)

■ Precautions when Using Wiper Inserts

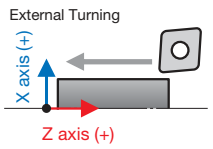
CNGA / CCGA / WNGA

WG Type / WH Type Wiper Insert

· Use a holder with a cutting edge angle of 95°.
· Machining program modification required CNGA / CCGA/ WNGA wiper inserts do not comply with the ISO standard. Correct the cutting edge position (tool offset) as explained on the right.



CNGA / CCGA / WNGA Wiper Insert Cutting Edge Position Offset (WG / WH)

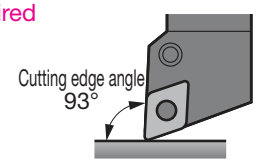


Nose Radius	Type	X-axis direction	Z-axis direction
.0156"	WG	-.0008"	-.0008"
	WH	-.0024"	-.0024"
.0313" / .0469"	WG	-.0004"	-.0004"
	WH	-.0024"	-.0024"

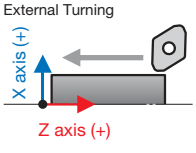
DNGA / DCGA

WG Type / WH Type Wiper Insert

· Use a holder with a cutting edge angle of 93°.
· Machining program modification required DNGA / DCGA wiper inserts do not comply with the ISO standard. Correct the cutting edge position (tool offset) as explained on the right.



DNGA / DCGA Wiper Insert Cutting Edge Position Offset (WG / WH)



Nose Radius	Type	X-axis direction	Z-axis direction
.0156"	WG	-.0067"	-.0004"
	WH	-.0276"	-.0024"
.0313"	WG	-.0020"	0
	WH	-.0228"	-.0020"

Note: Unlike other contour shapes, the DNGA / DCGA can only exhibit wiper effect for outer and inner diameter machining, and cannot be used for facing.

CBN Insert Edge Specification

CBN Insert Edge Treatment

All SUMIBORON inserts are enhanced with the optimum cutting edge preparation for the various grades and geometries (shown on the right). This is to avoid cutting edge fracture caused by the heavy loads generated during the machining of high-hardness materials such as hardened steel. As the pioneer of CBN tools, SUMIBORON's vast selection of grades and edge treatment combinations makes Sumitomo the world leader for hardened steel machining.

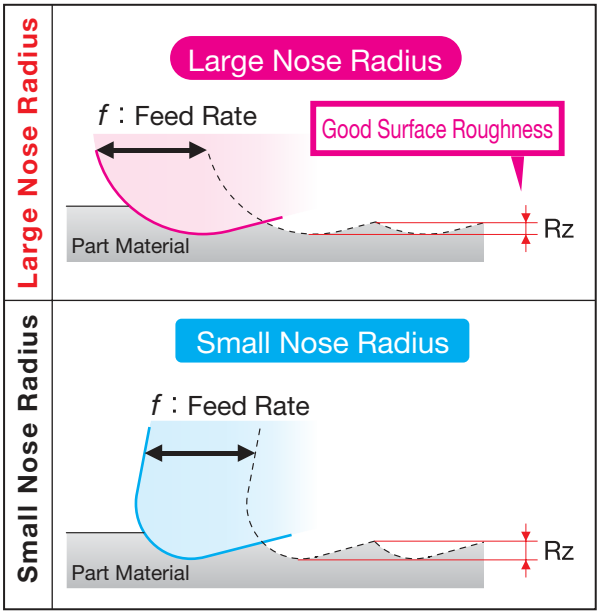
Inserts & Special Holders for High Efficiency Machining

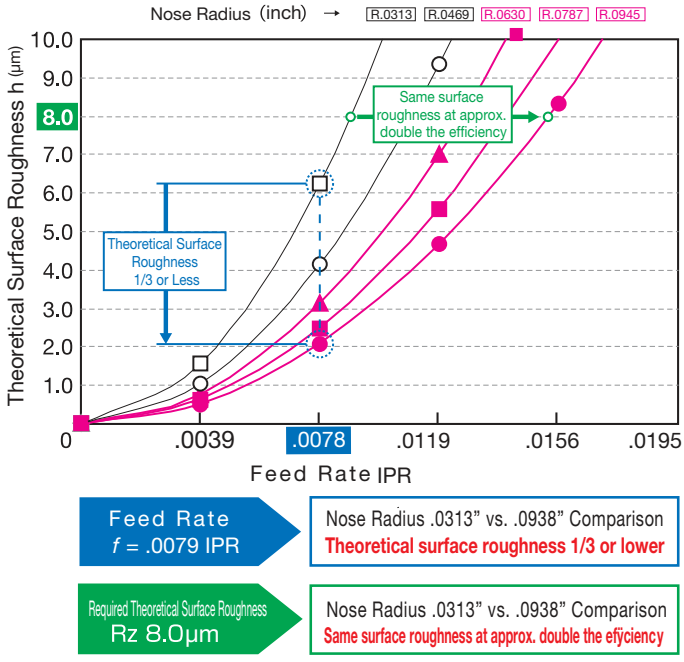
■ Features

- Improved finished surface roughness with high-feed cutting
- Ideal for profiling when when low surface roughness is required

● Operation with different nose radii



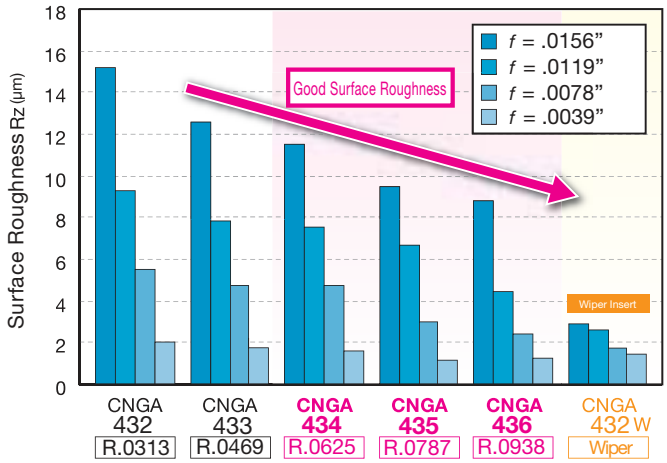
● Comparison of Theoretical Surface Roughness



Feed Rate *f* = .0079 IPR	Nose Radius .0313" vs. .0938" Comparison **Theoretical surface roughness 1/3 or lower**
Required Theoretical Surface Roughness Rz 8.0µm	Nose Radius .0313" vs. .0938" Comparison **Same surface roughness at approx. double the efficiency**

* Actual value of surface roughness is approximately 1.5 to 3 times higher (for steel).
* Theoretical surface roughness is calculated using the following formula: [h = (f^2 / 8r) x 10^3].

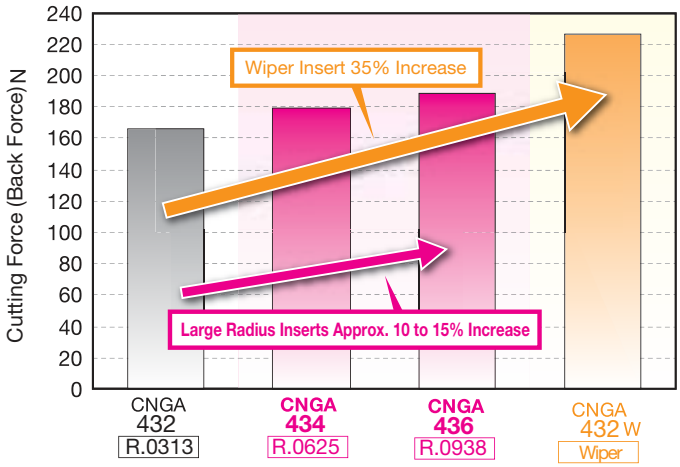
● Machined surface roughness comparison with different nose radii



Inserts with a larger nose radius also give better surface roughness during actual machining

Part Material: Chromium Molybdenum Steel (60HRC)
Cutting Conditions: v_c = 330 SFM, a_p = .0039" Dry

● Cutting force comparison with different nose radii



Low cutting force compared to wiper insert enables high-feed cutting

Part Material: Chromium Molybdenum Steel (60HRC)
Cutting Conditions: v_c = 500 SFM, f = .0117 IPR, a_p = .0039" Dry

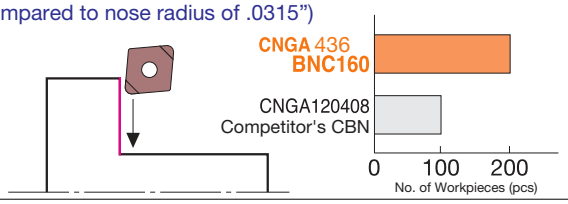
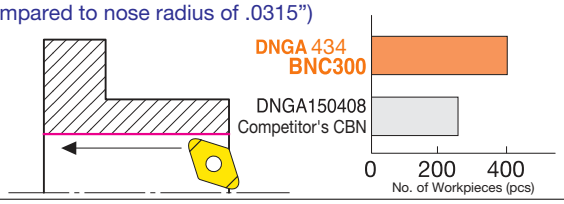
Application Example (For Automotive Components)

Nose radius of .094" achieves 2x greater tool life
(compared to nose radius of .0315")



Work Material: Carburised Steel (60HRC)
Cutting Conditions: [R.094"] v_c = 400 SFM, f = .014 IPR, a_p = .0079"
[R.0315"] v_c = 400 SFM, f = .0079 IPR, a_p = .0079"

Nose radius of .0630" achieves 1.5x greater tool life
(compared to nose radius of .0315")



Part Material: Carburized Steel (60HRC)
Cutting Conditions: v_c = 330 SFM, f = .0059 IPR, a_p = .0039"

BSME Type

■ Features

- Achieves the minimum bore diameter of ø2.5mm in boring of hardened steel
- Achieves high-precision cutting edge positioning thanks to the newly developed clamp mechanism
- Expands the range of small hole boring to achieve more high-efficiency machining requiring no grinding
- BSME Type (Brazed Type)
  Can be used with work diameters from ø2.5 to 5.0mm
- SEXC Type (Indexable Insert Type)
  Can be used with work diameters from ø4.0 to 6.0mm

Expansion | Carbide (Coolant Hole) | CBN

Alignment Jig

Cat. No.	Stock	
AFBSM60	★	
This jig is used for centring sleeves when setting them into holders.

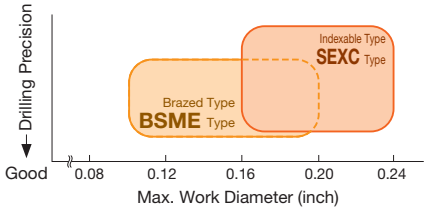
Application Range



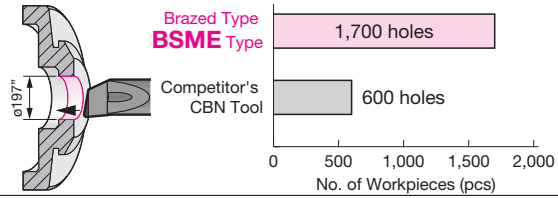
Recommended Cutting Conditions

Spindle Speed *n*	Above 2,000 RPM	May cause chattering or chipping at the cutting edge in low-speed machining.
Depth of Cut a_p	0.0004" to 0.006"	Excessive depth of cut causes deformation of the tool, which consequently leads to deterioration of dimensional tolerance.
Feed Rate *f*	0.0004 to 0.004 IPR	–

Application Examples

Hardened Alloy Steel Valve Component — BSME

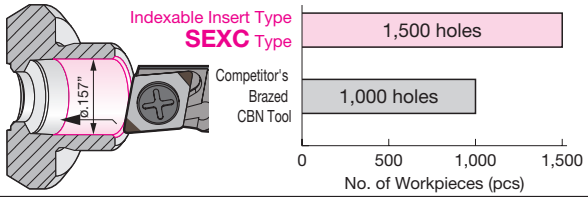
The BSME type provides stable machining and a tool life that is over 2 times longer than our competitors' CBN tools.



Part Material: Hardened Alloy Steel Valve Component (Automotive Component)
Tool: BSME R50020D2S6 Grade: BN2000
Cutting Conditions: v_c = 387 SFM (7,500 RPM), *f* = 0.0008 IPR, a_p = 0.004" Dry

Bearing Steel: Small Automotive Component — SEXC

The SEXC type provides drastically reduced tool costs and a tool life that is 1.5 times longer than our competitors' brazed CBN tools.



Part Material: Bearing Steel Small Automotive Component (60HRC)
Holder: E06D2-SEXC R/L03-04P Insert: 2NU-ECXA 030X02LF (BN2000)
Cutting Conditions: v_c = 164 SFM (4,000 RPM), *f* = 0.0008 IPR, a_p = 0.0008" Wet

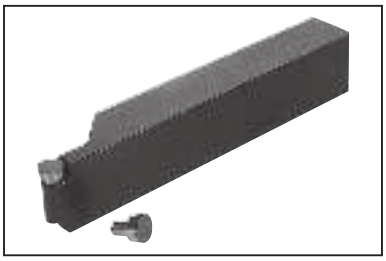
TRGT Type



- Clamping by cutting force alone
  - Secure clamping is achieved by inserting the tapered portion of the insert into the holder.
  - The lack of protrusions on the insert rake face allows smooth chip evacuation.
- Round insert enables various machining operations
  Small round insert with stable clamping can be applied to various machining operations.

Recommended Cutting Conditions (SJB Type)

Spindle Speed n	Above 800 min^{-1}	Low speeds may cause chattering and chipping on the cutting edge.
Depth of Cut a_p	.0039 to .0117 inch/ radius	Excessive depth of cut may cause larger tool deformation, resulting in deterioration of bore accuracy.
Feed Rate f	.0017 to .0039 IPR	-

Please refer to C Section: ceramic holders CRDNN (C48) and CRSN(R/L) and methods for holding dimple lock inserts

BNRN Type

- Insert can be reground and used again
  - The same holder can be used for a reground insert by adjusting the slide locator with a clamp.
- Reliable holder design
  - The tip of the clamp is a cemented carbide chipbreaker that can withstand wear from chips.
  - Slide locator uses HSS for durability.

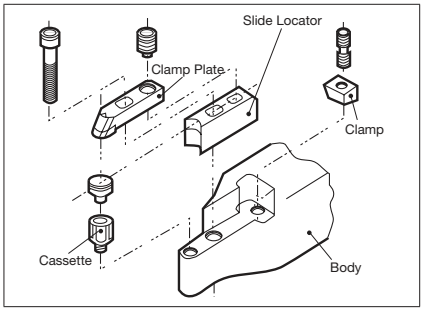
Structure



GWB Type

■ Features

- Vertically-mounted insert enhances tool rigidity
- Double clamping holder design improves stability during continuous and interrupted cutting. Can also be used for traverse cutting
- Long tool life for interrupted cutting applications with the Coated CBN-SUMIBORON BNC30G grade for grooving (BN2000 recommended for continuous cutting)
- Suited for grooving various types of hardened steel. Variety of widths available from .059 to .236" and 1.5 to 6.0mm

Fig 1

* It is also possible to manufacture widths of cut other than those listed above (CW = 1.5 to 6.0mm).

Grade Features (See page L9 for details on BN7000 & BN7500)

Grade	Application Range	Features	HV(GPa)	TRS(GPa)
BN2000	Continuous Grooving	General-purpose grade with superior wear resistance	31 to 34	1.0 to 1.1
BNC30G	Interrupted Grooving	Grade suited to interrupted grooving. Features tough substrate and special ceramic coating that exhibits both peel-off and wear resistance.	33 to 35	1.1 to 1.2

Recommended Cutting Conditions

Cutting Conditions	H Hardened Steel
Cutting Speed v_c (SFM)	260 to 400
Feed Rate f (IPR)	.0016 to .0032

* In order to avoid thermal cracking of the SUMIBORON cutting edge during interrupted cutting, ensure that the work material is thoroughly dry before cutting.

Application Examples

Tooling	Work Material	Tool Cat. No.	Cutting Condition	Tool Life Comparison

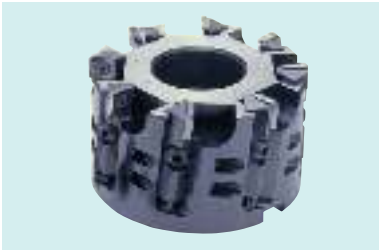
Feed Rate *f* (ipr)	.001 - .0025

• Threading

Cutting Conditions	H Hardened Steel
Cutting Speed v_c (m/min)	250 – 400
Feed Rate *f* (in.)	Maximum Pitch .118

N·m Recommended Tightening Torque (N·m)

High-speed Finishing for Cast Iron



- High speed finishing cutter for gray cast iron milling that uses removable cartridges enabling simple, precise, run-out adjustment.
- Utilizes BN7000/BN700 grade insert with excellent wear and fracture resistance.
- Available in shell type and small diameter type with shank.

■ Features

- High-speed machining at v_c = up to 6,600 SFM.
- Surpasses Ra 32 µin. finished surface roughness.
- Safety structure for centrifugal force under high-speed cutting conditions.
- Runout is less than 10µm: just attach the cartridge.
- Easy runout adjustment using external setting.
- Running cost is reduced because of the economical insert.

■ Application Range

Grey Cast Iron (200 to 250HB) with pearlite matrix
and Grey cast iron (130 to 160HB) with ferrite matrix
[Example] Engine blocks, cylinder heads, etc.

■ Specifications

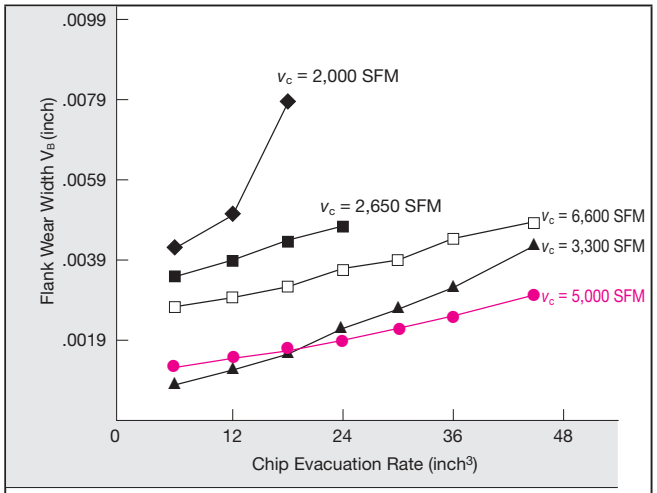
• Shell	ø80 to ø315mm (FMU Type)
With Shank	ø40 to ø63mm (FMU-E Type)
• Regular Blade	SNEW1203ADTR/L
• Low Thrust Blade	SNEW1203ADTR/L-S

■ Recommended Cutting Conditions

• Cutting Speed	v_c = 2,650 to 6,600 SFM
• Feed Rate	f_z = .004" to .012 IPT
• Depth of Cut	a_p = .020" or less
• Coolant	Dry

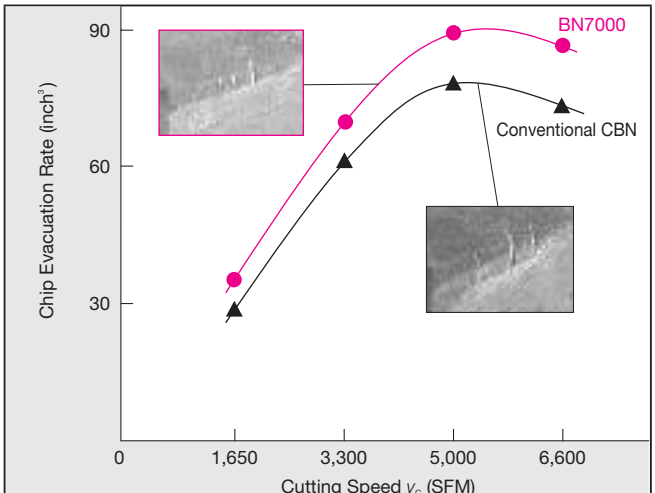
■ Cutting Performance

• Wear Diagram



Part Material: Grey Cast Iron240HB (Pearlite)
Cutting Speed: v_c = 2,000 to 6,600 SFM Feed Rate: f_z = .0059 IPT
Depth of Cut: a_p = .0197" , Dry Tool Grade: BN700

• Estimated Tool Life



Part Material: Grey Cast Iron(Pearlite)
Cutting Speed: v_c = 1,650 to 6,600 SFM Feed Rate: f_z = .0079 IPT
Depth of Cut: a_p = .0118" Dry Tool Cat. No.: FMU4100R SNEW1203ADTR

Milling of ductile cast iron and alloy steel casting does not produce the best results. Dry cutting is recommended. Wet cutting will result in breakage of cutting edges in the early stages due to thermal cracking.

Important Notes

(1) Use a high-rigidity machine and select a high cutting speed with a low depth of cut.
(2) Use dry cutting conditions.

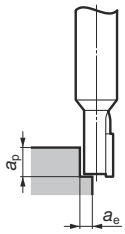
Grade: BN350



Recommended Cutting Conditions

1. Use dry cutting (air blow) conditions.
2. Down cut (climb milling) is recommended.
3. Make overhang as short as possible and use a high-rigidity machine.

Surface Milling

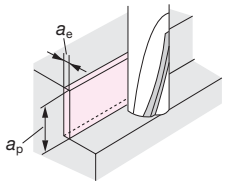
Part Material (Hardness)	High-Hardness Hardened Steel (50 to 57HRC)		
Cutting Conditions	Cutting Speed V_C 100 to 170m/min		
DC(mm)	Spindle Speed (min^{-1})	Feed Rate (mm/min)	Depth of Cut a_e (mm)
ø6 to 8	4,000 to 9,000	240 to 540	up to 0.1
ø10 to 12	2,700 to 5,400	180 to 360	up to 0.15
ø14 to 16	2,000 to 3,800	140 to 260	up to 0.2

Part Material (Hardness)	High-Hardness Hardened Steel (58 to 65HRC)		
Cutting Conditions	Cutting Speed V_C 80 to 150m/min		
DC(mm)	Spindle Speed (min^{-1})	Feed Rate (mm/min)	Depth of Cut a_e (mm)
ø6 to 8	3,200 to 8,000	150 to 370	up to 0.08
ø10 to 12	2,100 to 4,800	120 to 370	up to 0.12
ø14 to 16	1,600 to 3,400	110 to 230	up to 0.15

Performance

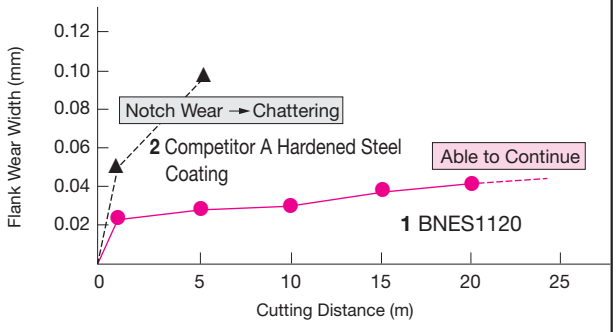
● Wear resistance enables high-efficiency machining

Tooling ●Side Milling



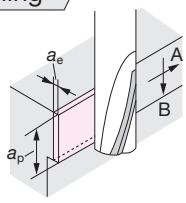
Cutting Conditions

●Work Material: SKD11 (Hardened) 60HRC
●Cutting Conditions: **1** v_c = 100m/min
v_f = 186mm/min
2 v_c = 40m/min
v_f = 186mm/min
Down-cut, Dry
a_p = 8mm, a_e = 0.05mm



● Finished surface roughness similar to grinding

Tooling ●Side Milling



Cutting Conditions

●Work Material: SCr15 (Hardened) 55 to 58HRC
●Cutting Conditions: v_c = 130m/min
v_f = 310mm/min
Down-cut, Dry
a_p = 4mm, a_e = 0.05mm

Grade: BNX20

Recommended Cutting Conditions

1. Use a machine with high rigidity for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant.
   Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions as necessary as machine rigidity and other conditions may vary.
5. Depths of cut shown in the table of conditions are maximum depths. Adjust the actual depth of cut to the desired machined surface roughness.

Recommended Cutting Conditions

1. Use a machine with high rigidity for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant.
   Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions according to actual conditions as machine rigidity and other conditions may vary.
5. Depths of cut shown in the table of conditions are maximum depths. Adjust the actual depth of cut to the desired machined surface roughness.

Recommended Cutting Conditions

1. Use a high-rigidity machine and select a high cutting speed with a low feed rate.
2. Use dry cutting conditions.
3. Make overhang as short as possible.
4. If the work material hardness is lower than 50HRC, try the GSX Ballnose endmill .

PCD Inserts

■ General Features

Sumitomo PCD - SUMIDIA® sintered diamond series has 4 grades (DA90, DA150, DA2200, DA1000) with individual features depending on the optimum combination of diamond particle size and binder, as well as the NPD10 grade (nano-polycrystalline diamond) where nano-order diamond particles are directly bound with high strength without using binders.
PCD is suited for a wide range of applications from machining of aluminum alloy to machining of hard brittle materials and cemented carbide.

■ Grades, Features and Applications

Grade		Features	Applications	Average grain size of diamond particles (μm)	Hardness HK (GPa)	Transverse Rupture Strength (GPa)
SUMIDIA Binderless	NPD10	100% diamond structure that directly binds nano-order diamond particles with high strength. Demonstrates optimum wear and fracture resistance as well as the best edge sharpness.	· Finishing of Cemented Carbide · Machining of Hard Brittle Material (Ceramics)	up to 0.05	120 to 130	≈ 3.15
SUMIDIA®	DA1000	High-density sintered grade made of ultra-fine grained diamond that demonstrates excellent wear and fracture resistance as well as edge sharpness.	· Machining of High-Silicon Aluminum Alloy · Rough, Interrupted and Finishing Machining of Aluminum Alloy · Woodcraft or Wooden Board Cutting/ Facing · General Finishing of Non-Ferrous Metals	up to 0.5	50 to 60	≈ 2.60
	DA2200	Sintered grade made of ultra-fine grained diamond that demonstrates optimum wear and fracture resistance and excellent edge sharpness.	· Rough, Interrupted and Finishing Machining of Aluminum Alloy · Woodcraft or Wooden Board Cutting/ Facing	0.5	45 to 55	≈ 2.45
	DA150	Grade with micro-grained sintered diamond particles. With strong diamond particle bonding, it has an excellent balance of machinability and wear resistance.	· General Finishing of Non-Ferrous Metals · Finishing of Semi-Sintered Ceramics and Mold-Extruded Products · FRP, Hard Rubber & Carbon Cutting · Wooden or Inorganic Board Cutting/Facing	5	50 to 60	≈ 1.95
	DA90	Contains coarser diamond particles than other grades, giving it good wear resistance suitable for the machining of carbides and high-silicon aluminum. Shows the highest diamond content for excellent wear resistance.	· Machining of High-Silicon Aluminum Alloy · Machining of Aluminum Composite (MMC) · Green or Semi-Sintered Cemented Carbide & Ceramic Roughing · Machining of Sintered Ceramics/Stone/ Rock	up to 50	50 to 65	≈ 1.10

Transverse rupture strength measured with test piece equivalent to insert PCD layer

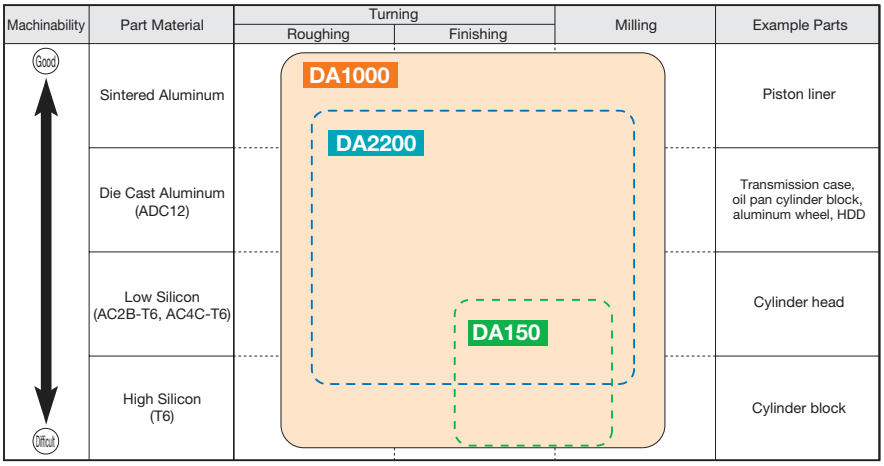
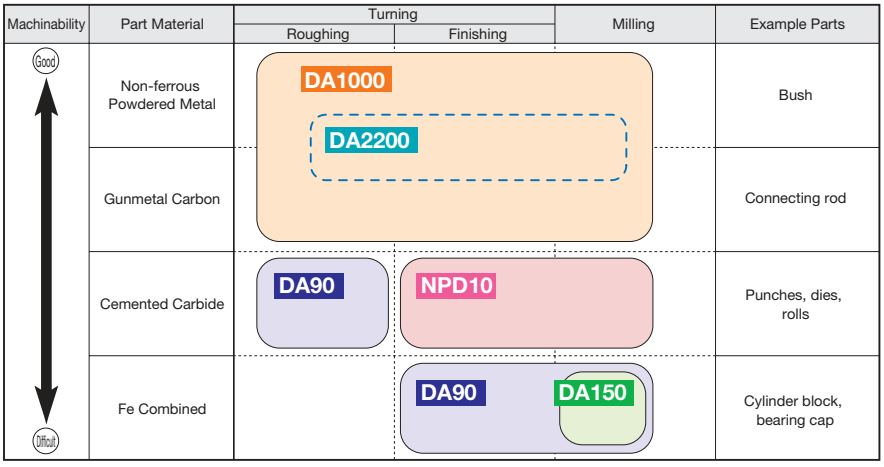
PCD Inserts

■ Application Range

● Aluminum



● Non-aluminum



■ Recommended Cutting Conditions

Part Material	Cutting Speed v_c(SFM)	Feed Rate f(IPR)	Depth of Cut a_p(inch)
Aluminum Alloy	up to 9,850	up to 0.008	up to 0.12
Copper Alloy	up to 3,300	up to 0.008	up to 0.12
Reinforced Plastics	up to 3,300	up to 0.016	up to 0.079
Wooden or Inorganic Board (cutting, etc.)	up to 13,100	up to 0.016	—
Cemented Carbide	up to 100	up to 0.008	up to 0.0197
Carbon	330 to 1,970	0.04	0.079

■ PCD (SUMIDIA) Grinding Method

Functions		Description
Grinding Machine	—	(1) A special-purpose high-rigidity grinding machine. (2) Capable of wet grinding operations.
Grinding Wheel	Abrasive Grain	Diamond
	Grain Size	Rough Grinding: 400 mesh, Finish Grinding: 800 to 1,500 mesh
	Bond	Vitrified or Metal Bond Dedicated for Polycrystalline Diamond Tool
	Concentration	100 to 125
	Dressing	Use a WA stick with a mesh of about 400.
Grinding Conditions	Peripheral Speed	2,600 to 3,300 SFM
	Table Rocking	30 to 60 cycle/min
	Grinding Fluid	Water-soluble Grinding Fluid (Solution Type)
Others	—	(1) The rake face is generally lapped. (2) Inspect for edge chipping using a microscope with a magnification of 30 to 50 times. (3) Machining of non-ferrous metals requires a sharp cutting edge. (4) Surfaces that were cut by EDM should have more than 0.002" ground off.

*Please contact us for details on regrinding of NPD10.

PCD - SUMIDIA Binderless Inserts

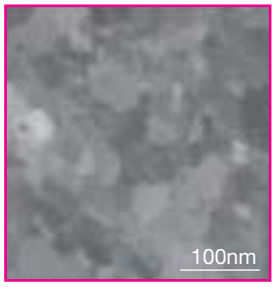
Nano-Polycrystalline Diamond

■ General Features

Nano-polycrystalline diamond is polycrystalline diamond that directly binds nano-order diamond particles with high strength without using any binders. This proprietary Sumitomo material is harder than polycrystalline diamond with a binder, achieving excellent wear resistance and fracture resistance.
Binderless PCD tools use this super-high-performance nano-polycrystalline diamond material in their cutting edges.

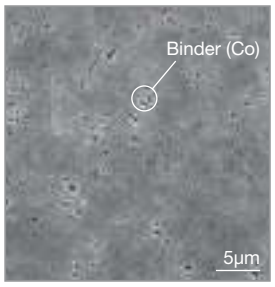
■ Comparison of Structures

Nano-Polycrystalline Diamond Tool SEM Profile



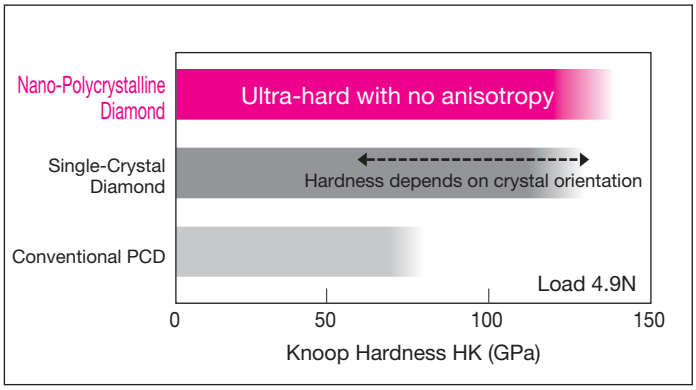
Diamond particles (30 to 50nm)

Conventional PCD SEM Profile



Diamond particles (1 to 10μm)

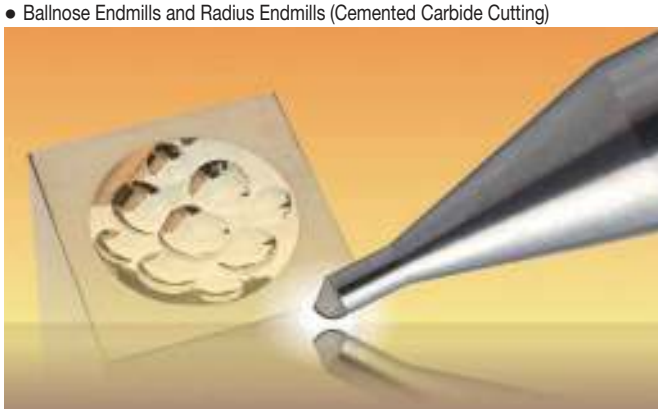
■ Hardness



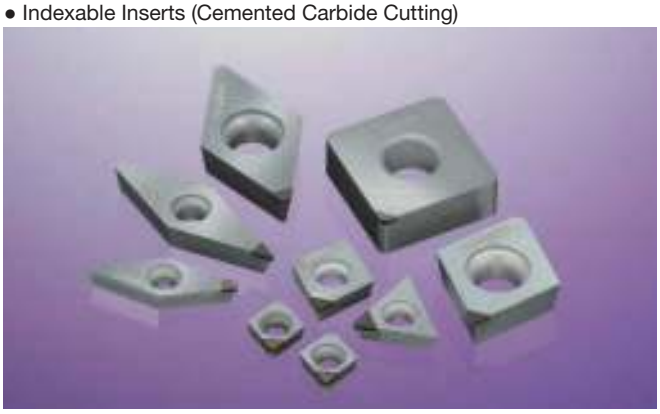
PCD - SUMIDIA - Binderless

■ Application Examples

● Ballnose Endmills and Radius Endmills (Cemented Carbide Cutting)



● Indexable Inserts (Cemented Carbide Cutting)



● Drill (Drilling of Ceramics)

● Tool Holder (Ultra-Precision Cutting of Cemented Carbide)

NPD10/DA90

■ General Features

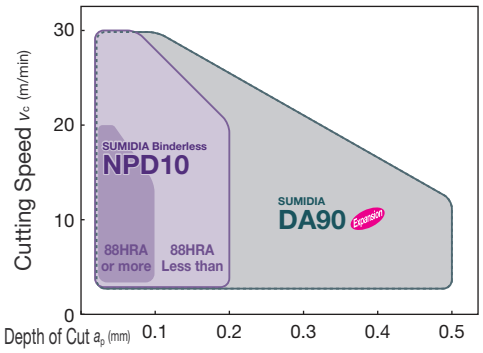
NPD10 is made from high-hardness nano-polycrystalline diamond. This is a pure diamond material, but unlike single-crystal diamonds, it has no anisotropy.
It achieves extended tool life and machining accuracy superior to conventional diamond tools when machining hard brittle materials such as cemented carbide.

DA90 is a PCD - polycrystalline diamond grade in which coarse diamond particles have been sintered to form a dense structure. The high diamond content, with high wear resistance, makes it ideal for roughing of cemented carbide and hard brittle material.
Optimized design and mass production technology have been developed, achieving the same performance as conventional tools with higher cost-performance.

■ Features

- Ideal for Finishing of Hard Brittle Materials Including Cemented Carbide (NPD10)
  High-precision cutting of cemented carbide thanks to the outstanding wear resistance of nano-polycrystalline diamond
- Superior dimensional tolerance maintained for a long time (NPD10)
  Tool replacement count can be drastically reduced compared to conventional diamond tools, enabling work efficiency to be improved and total costs to be reduced.
- Ideal for Roughing of Hard Brittle Materials Including Cemented Carbide (DA90)
  Stable tool life in sintered surface machining of cemented carbide and roughing of hard brittle materials thanks to the outstanding wear resistance of the coarse-grained polycrystalline diamond
- Uses PCD - SUMIDIA NF Insert (DA90)
  Optimized design and mass production technology have been developed, achieving the same performance as conventional tools with higher cost-performance.

■ Application Range (Cemented Carbide Machining)



■ Applications of NPD10 and DA90 (Cemented Carbide)

Grade	SUMIDIA Binderless NPD10		SUMIDIA DA90	
Dimensional Tolerance	◎	Best	△	The first recommendation is NPD10
Tool Life (Wear Resistance)	◎	Best a_p = 0.008" or below f = 0.004 IPR or below recommended	○	a_p = 0.008" or above can also be used
Sintered surface machining of cemented carbide	×	Impossible	◎	Best
Machined surface quality	◎	Best	△	The first recommendation is NPD10

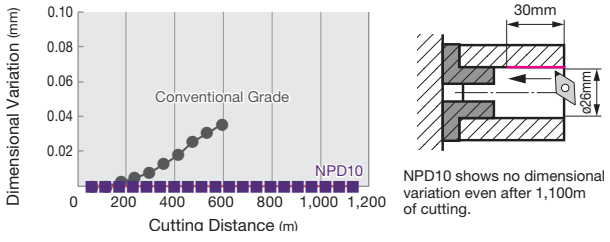
■ Recommended Cutting Conditions (Cemented Carbide Machining)

Part Material				Grade	Cutting Conditions		
Class		Hardness (HRA)	Our Grades		Cutting Speed v_c (SFM)	Feed Rate f (IPR)	Depth of Cut a_p (Inch)
VM, VC	40	88 or more	G5, D2	NPD10	15 - 65	.0012 - .0027	.0012 - .0027
VM, VC	70, 60, 50	83 less than 88	G7, G6	NPD10	15 - 100	.0012 - .0079	.0012 - .0079
VM, VC	—	83 or more	G7, G6 G5, D2	DA90	15 - 100	.0012 - .0079	.0012- .0197

Min. - Max. Coolant: Dry (NPD10)/Wet (DA90)

■ Machining Precision (NPD10)

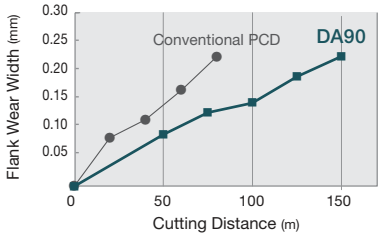
Internal machining of cemented carbide: VM30 (91HRA)



Part Material : Cemented carbide: VM30 (91HRA)
Tool Cat. No. : DCMW 11T304RH
Cutting Conditions : v_c=65 SFM, f=0.002 IPR, a_p=0.002" Dry

■ Wear Resistance (DA90)

External machining of cemented carbide: VC50 (87HRA)



Part Material : Cemented carbide: VC50 (87HRA)
Tool : NF-DCMW 070204
Cutting Conditions : v_c=65 SFM, f=0.004 IPR, a_p=0.008" Wet

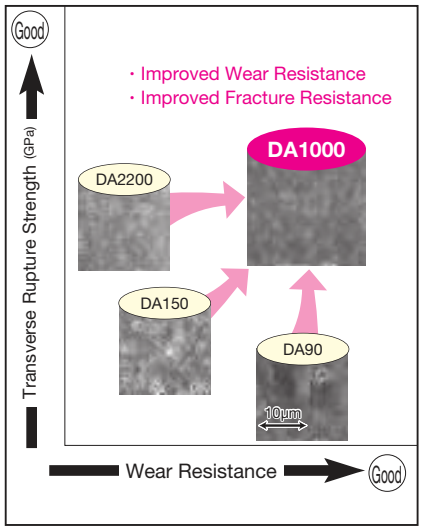
DA1000

■ Features

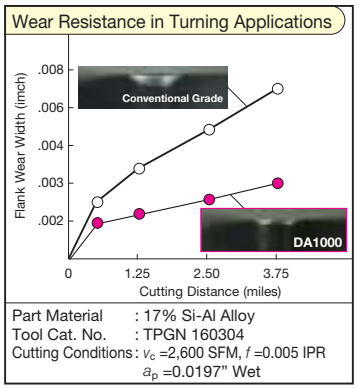
Ultra-high-density sintered ultra-fine grained diamond

- Significantly improved surface roughness on machined surfaces
- Excellent wear resistance and strength
- High-performance, high-precision, high-efficiency machining of all aluminum and non-ferrous alloys

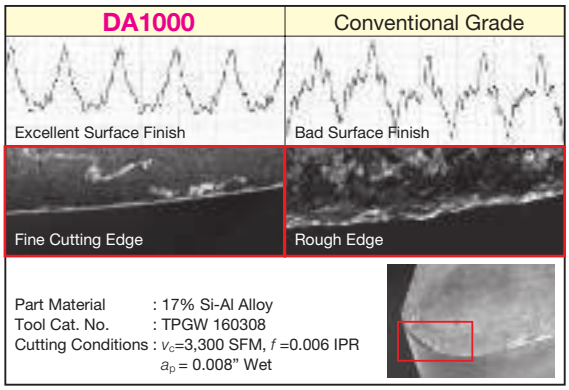
■ Position of DA1000



■ Cutting Performance



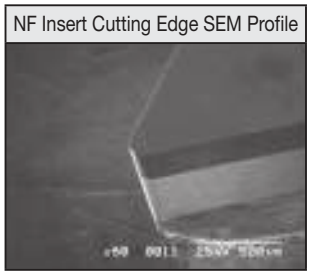
Part Material : 17% Si-Al Alloy
Tool Cat. No. : TPGN 160304
Cutting Conditions : v_c =2,600 SFM, f =0.005 IPR
a_p =0.0197" Wet



Part Material : 17% Si-Al Alloy
Tool Cat. No. : TPGW 160308
Cutting Conditions : v_c=3,300 SFM, f =0.006 IPR
a_p = 0.008" Wet

■ NF Insert

The NF PCD insert uses optimized design and improved mass production techniques that maintain good performance of DA1000 yet offer higher cost efficiency. It makes the most of the PCD - SUMIDIA DA1000 grade, with excellent fracture and wear resistance and good work material finished surface roughness.

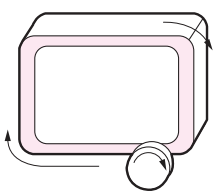


High-precision cutting edge quality

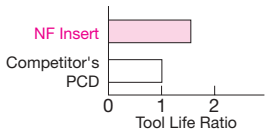
- Total cost effectiveness with high performance and lower price
  - · Optimum design utilizing improved mass production techniques provides a lower cost.
  - · Regrindable type results in huge total cost reduction.
- Wide lineup from general turning to milling
  - · Wide range of items in stock for small diameter boring and external turning to milling.
  - · Negative/positive type inserts that can be used on standard lever-lock and pin-lock type holder are also in stock.

■ Application Examples

• Milling of Aluminum Alloy Oil Pump Cover

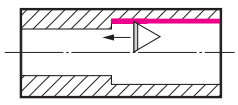


Results:
1.5 times longer tool life than competitors' PCD, with higher cost performance.

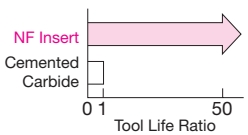


Part Material : A383 Aluminum, Tool Cat. No.: NF-TEEN32R
Cutting Conditions : v_C = 9,850 SFM, f_Z = 0.0024 IPR, a_p = 0.008" Wet

• Boring of Aluminum Valve Bore



Results:
No initial breakage, tool life is more than 50 times that of carbides.



Part Material : A383 Aluminum, Tool Cat. No.: NF-TPGN110304P
Cutting Conditions : v_C = 1,750 SFM, f = 0.00197 IPR, a_p = 0.008" Wet

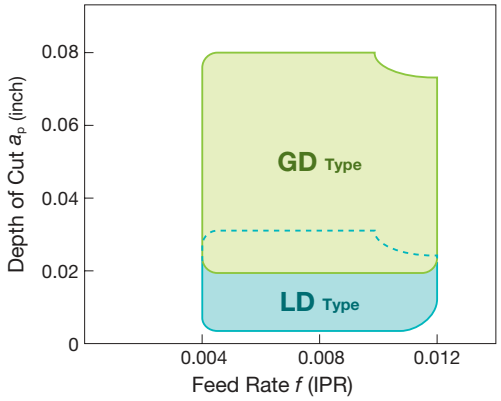
LD / GD

■ Features

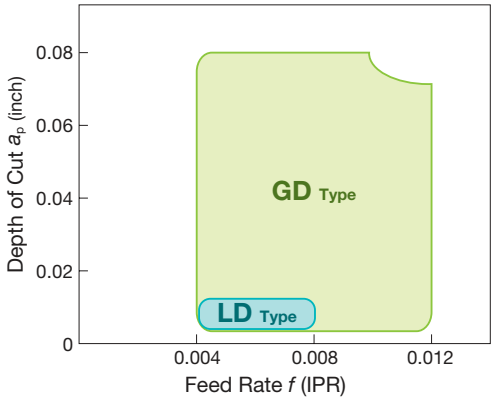
- PCD insert with chipbreaker
- Provides excellent chip control in medium finishing and finishing of aluminum alloy.
- Solves chip control problems and dramatically improves work efficiency.
- Achieves long, stable tool life by employing high-toughness grade DA1000.

■ Application Range

● Wrought Aluminum Alloy (6061)



● Cast Aluminum Alloy (A383)



LD Type Chipbreaker for Finishing

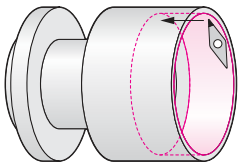
Provides excellent chip control in finishing

■ Cutting Performance

For Wrought Aluminum Alloy Machining

● Machining Details: Internal Diameter Machining of Machine Components

Provides good chip control at shallow depths of cut for wrought materials



Break Master LD Type

Without Chipbreaker

Part Material: 6061 Aluminum, Tool Cat. No.: NF-VCMT110302N-LD (DA1000)
Cutting Conditions : v_c = 650 SFM, f = 0.008 IPR , a_p = 0.004" Wet

GD Type Chipbreaker for Medium Finishing

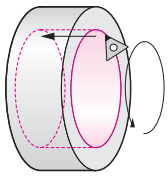
Provides excellent chip control in medium finishing

■ Cutting Performance

For Aluminum Alloy Casting Machining

● Machining Details: Internal Diameter Machining of Transmission Components

Finely breaks chips in machining of cast materials



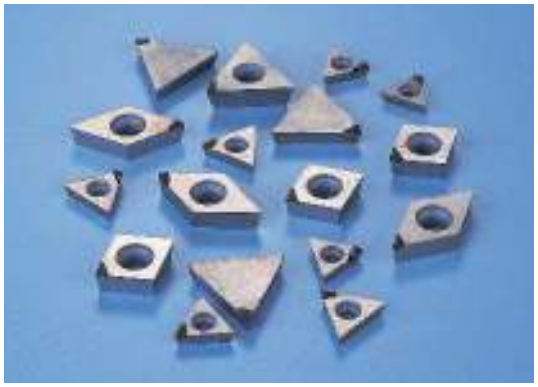
Break Master GD Type

Without Chipbreaker

Part Material: A383 Aluminum, Tool Cat. No.: NF-TPMT110304N-GD (DA1000)
Cutting Conditions : v_c = 1,312 SFM, f = 0.009 IPR, a_p = 0.087" Wet

Note: Regrinding this product will adversely affect chip control performance.

DM



■ Features

- Economy One-Use Type

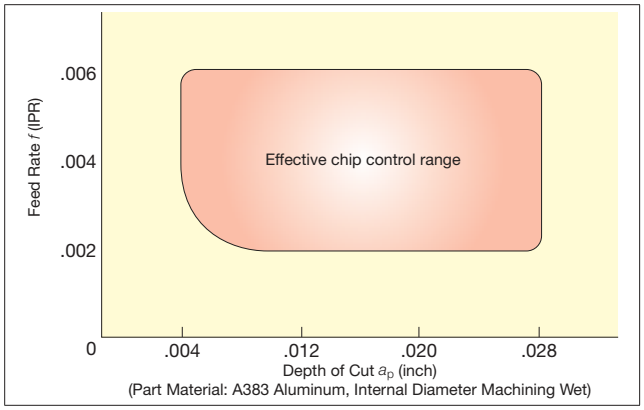
  Familiar to users of CBN - SUMIBORON one-use inserts, now available in PCD - SUMIDIA.

- Cutting Edge with Built-in Chipbreaker for Effective Chip Control

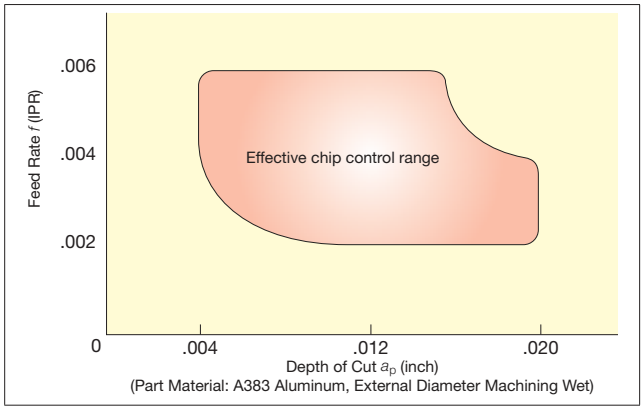
  DM Type chipbreaker solves chip control problems and greatly improves efficiency.

■ Application Range

- For Internal Diameter Machining



- External Turning & Facing (Insert Shape: 55°/80° Diamond Type)



■ Chip Control

- Chips Created by Break Master DM Type

- Chips with No Chipbreaker

■ Application Examples

Machining Details	Cutting Conditions	Results
Internal Boring	Part Material: Aluminum Alloy (AC2A-T6) V_c = 985 SFM f = 0.0024 IPR a_p = 0.014" Wet	With the required finished surface roughness of Ra = 1µm or less, the chips curled at lengths of 2mm or so, and did not remain within the work material.

■ Recommended Cutting Conditions

- Internal Diameter Machining (Insert Shape: Triangular Type)

Feed Rate f	Depth of Cut a_p	Coolant
up to .006 IPR	up to 0.028"	Wet

- External Profiling (Insert Shape: 55°/80° Diamond Type)

Feed Rate f	Depth of Cut a_p	Coolant
up to .006 IPR	up to 0.0197"	Wet

For facing, depth of cut should be less than 0.016".

■ General Features

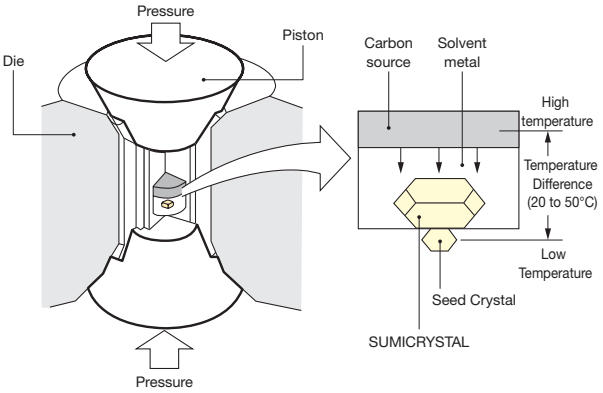
SUMICRYSTAL is the world's first commercially available large-grained high-purity single-crystal diamond, developed by Sumitomo.
Thorough quality control has achieved stable quality, making SUMICRYSTAL ideal as an industrial material.

■ Production Method

The synthetic single-crystal diamond SUMICRYSTAL is synthesized in a super high pressure chamber from 5 to 6GPa and high temperatures from 1,300 to 1,600°C. The temperature difference between the raw carbon and the seed crystal is used to grow the diamond on the seed crystal. Through this stringent control of pressures and temperatures, a more stable structure with minimal impurities can be obtained.

● Inside a super high pressure chamber

Synthetic Conditions
Pressure: 5 to 6GPa
Temperature: 1,300 to 1,600°C

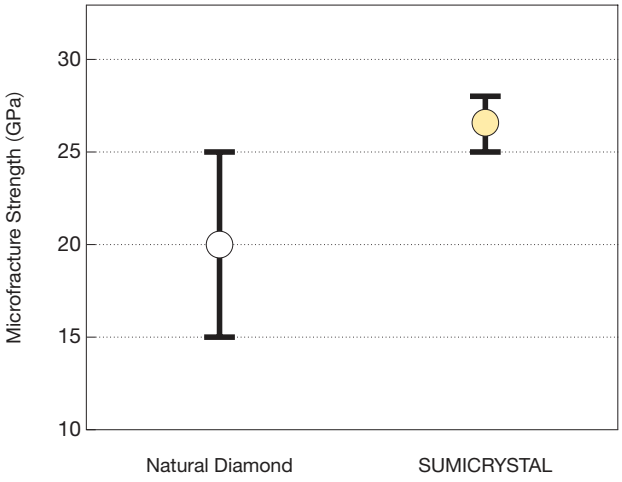


■ Properties

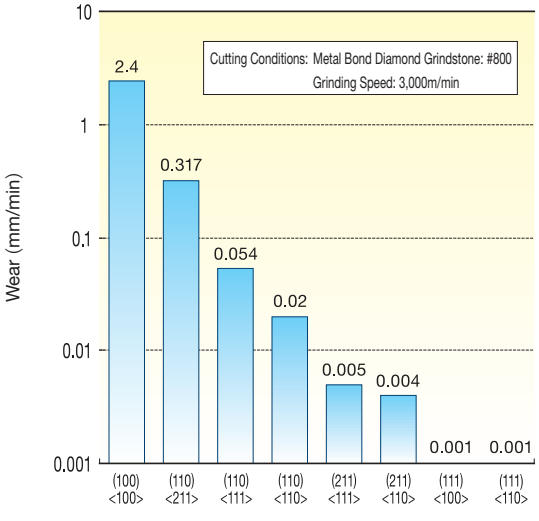
SUMICRYSTAL has 4 main advantages over natural diamond.

1) Structural advantage: Natural diamond is rounded and the crystal orientation is difficult to determine with the naked eye. SUMICRYSTAL, however, has a distinct crystal face which makes the identification much easier.
2) Uniformity: Due to the strictly controlled conditions in which the crystals are grown, uniform quality is obtained consistently.
3) Availability: Unlike the limited supply of natural diamonds, SUMICRYSTAL can be mass produced.
4) SUMICRYSTAL diamond type Ib, which is used for tools, has mechanical and thermal properties equal to or even greater than natural diamond, while containing trace amounts of nitrogen impurities.

● Microfracture Strength of Synthetic Diamond



● Orientation and Wear Resistance



PD / PDX

■ General Features

SUMICRYSTAL PD and PDX are single-crystal synthetic diamonds processed into thin prism shapes for use as dresser blanks. Their stable performance and long tool life improve dressing precision.

SUMICRYSTAL PD

■ Features

● Revolutionary Elongated Shape

(1) Improved retention strength prevents diamonds from falling out.
(2) Consistent cross-section prevents deterioration.
(3) Uniform crystal orientation promotes stable tool life.

■ Standard Cat. No. (PD)

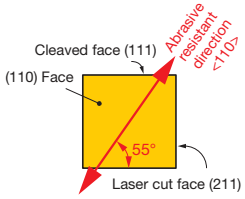
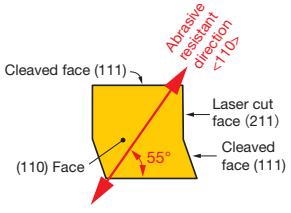
* 1 Sizes other than those indicated above can be ordered. ● mark: Standard stocked item
* 2 These products may have fine impurities within Sumitomo's prescribed range.
* 3 The laser cut faces among other product areas may have chipping within Sumitomo's prescribed range.

■ PD Crystal Orientation

PD

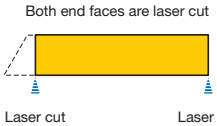


PD-T



■ KK Type

Apart from the standard items listed above, PD is also available in the KK type with both end faces laser-cut.



· When ordering, include "K" after the standard catalogue number.
(Example: PD○○○○KK,
PD○○○○TKK)

· PD0220 and 0420 are not available in the KK type.

SUMICRYSTAL PDX

■ Features

● Compared to conventional tools (PD), the product has different face crystal orientation.

(1) Crystal orientation (211) provides better tool life than conventional PD blanks.
(2) Parallel abrasive resistant faces (111) facilitate blank setting during manufacturing of dressers.

■ Standard Cat. No. (PDX)

UP

■ General Features

Of today's sophisticated cutting-edge technologies, ultra-precision machining processes such as those used for optical element molds are seeing particularly rapid development.
SUMICRYSTAL UP blanks have high performance and reliability, making them optimally suited to these applications.

■ Features

(1) High quality with very low variance.
Stable wear resistance with excellent resistance to cutting edge chipping.
(2) Minimal stock removal during cutting edge formation.
Uniform shape facilitates cutting edge formation.

■ Standard Type

Rectangular parallel type with 6 (100) faces.

■ Economy Type

Peripheral growth faces and top are not cut. Benefits include large volume and low cost.

● Cutting Tools Using SUMICRYSTAL UP

Wiper Insert for High-Efficiency Cutter for Aluminum Alloy RF Type →M46

* This product was jointly developed with A.L.M.T. Corp.

SUMICRYSTAL SC10 (Wiper Insert)

- SUMICRYSTAL, a single-crystal diamond produced with SEH's original super-high pressure technology, is used for the cutting edge.
- Edge sharpness is retained better than sintered diamonds, greatly reducing burr formation.

SUMICRYSTAL (Single-Crystal Diamond) Surface machined with SC10 wiper insert

Surface machined with SUMIDIA (Sintered Diamond) wiper insert

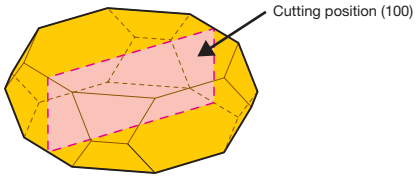
■ General Features

SUMICRYSTAL UP Half Cut products are materials for holders consisting of the UP Economy type material cut in half along the (100) or (110) faces.

■ Features

(1) Grinding during tool production minimizes the volume removed, reducing machining loss.
(2) Similar shape to the completed tool, reducing material costs.
(3) The cut surface is a smooth laser surface.

■ Type cut along (100) face



■ Type cut along (110) face

*1 Sizes other than those indicated above can be ordered. Blank: Made-to-order item
*2 Fine impurities, chipping, etc. within Sumitomo's prescribed range may be present in the minimum guaranteed dimensions of these products.
*3 Impurities, chipping, etc. outside the inspection range may be present outside the minimum guaranteed dimensions of these products.
*4 Some products have ground top surfaces.

UPT

■ General Features

SUMICRYSTAL UPT is a material for holders with a 2-point surface ((110) face) as the main surface.

■ Features

(1) 2-point surface ((110) face) enables use for the same applications as with holders using conventional natural diamonds.
(2) Distinctive shape minimizes the volume removed to make the cutting edge, enabling efficient machining.

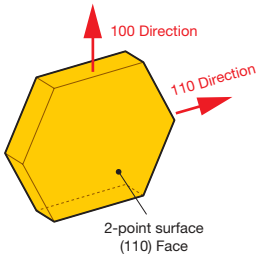
■ Standard Items

Dimensions (mm)

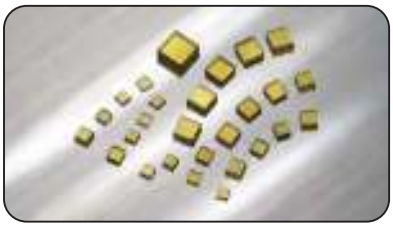
Shape	Cat. No.	Stock	W	L	T
	**UPT 3010**		3.0	2.5	$1.0^{\pm 0.1}$
	UPT 3012				$1.2^{\pm 0.1}$
	UPT 4010		4.0	3.0	$1.0^{\pm 0.1}$
	UPT 4012				$1.2^{\pm 0.1}$

*1 Sizes other than those indicated above can be ordered. Blank: Made-to-order item
*2 Fine impurities, chipping, etc. within Sumitomo's prescribed range may be present at the top (1/2).
*3 Impurities, chipping, etc. outside the inspection range may be present at the bottom (L/2).

■ UPT Crystal Orientation



CD



■ General Features

SUMICRYSTAL CD has optimized crystal orientation and shape as a material for wire drawing dies. Realizing excellent performance through high quality and stability.

■ Features

(1) High quality with very low variance.
High-quality crystal with minimal impurities, chipping and distortion is used to achieve high, stable wear resistance. It also eliminates the need for inspection and selection of raw stones required for natural diamond.

(2) High fracture strength
Resistant to fracture and cracking during wire drawing.

(3) Accurate crystal orientation
(111) is used on the top and bottom surface, limiting crystal misorientation, which causes variance in tool life, to within 1°.

(4) No grinding needed for top and bottom surface
The top and bottom surface are cleaved to form parallel surfaces, eliminating the need for grinding of the top and bottom surface.

■ Standard Type

The outside is machined by laser, achieving a consistent shape for easy setting. Mounting pressure is applied evenly, ensuring sufficient strength even for small volume. Ideal for applications with limited dimensions, such as nozzles and wire guides.

CNC Holders

CNC Holder line provides options for all industry-standard sizes and congurations for collet chucks, end mill holders, shell mill holders, hi-power milling chucks, and face mill holders.

Each product represents the latest technology, and reects our commitment to quality and innovation. We also support our products with unmatched application expertise and customer service.

Induction Shrink-Fit System

The finest shrink fit holders available. Precise manufacturing and exclusive “counter bore” technology optimize the advantages of using shrink fit tooling. These holders offer the best part finish quality, longer tool life, and higher feed rates and speeds. All of this is accomplished due to micrometer accuracy in runout, high cutting tool rigidity and extremely high clamping forces.

Tightening Fixtures

Our tightening fixtures are the best and simplest in the world. You gain immediate access to both the working and taper ends. Less handling just means fewer chances of costly holders being dropped and damaged.

ThermoGrip® Machine: ISG3430TWK-11-WS

This processor controlled ISG3430TWK-11-WS unit is simple to use. All that needs to be done is to select the tool diameter range. After the induction coil is positioned around the tool holder, push the start button and the coil heats the tool holder sufficiently. When heat cycle is completed, move the coil upward away from tool. Raise the cooling sleeve and press the cooling button, allowing the tool to cool in seconds.

ISG3430TWK-11-WS: It is universal shrinking unit for the professional use of shrinking technology. With its unique coil changing system, the power transfer adjusted to different clamping chucks is guaranteed within a short period of time. Compared to other systems, this makes it possible to clamp the smallest diameter tools. This allows for a constant preparation of a high number of tools. Guaranteed.

ThermoGrip® Machine: ISG3430TWK-11-WS			
Catalog No.	ISG3430TWK-11-WS	Max Tool Length	400mm 15.75”
Dimensions D x W x H	800mm x 560mm x 950mm 31.5” x 22” x 38”	Max Cooling Length	160mm 6.3”
Clamping Range SC	6-32mm 1/8”-1-1/4”	Cooling Type	Liquid/ emulsion
Clamping Range HSS	6-32mm 1/4”-1-1/4”	Cooling Time	20 Seconds
Coil	Quick Change	Geometry Independent Cooling	Yes
Electric Current Supply	3x480V-16A	Max Machine Interface	HSK 100 CAT50
Power kW	11 kW	Required Accessories	setting pot
Weight	115 lbs	Optional Accessories	setting pot

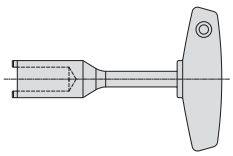
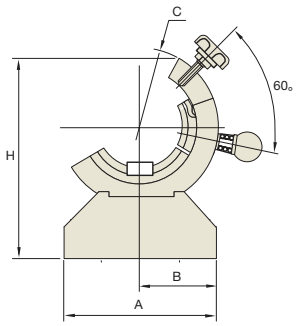
Wrench for HSK Coolant Tubes



Catalog Number	For Size
S-HSK 32-8.5x115	HSK 32
S-HSK 40-10.5x115	HSK 40
S-HSK 50-14.5x115	HSK 50
S-HSK 63-16.5x136	HSK 63
S-HSK 80-18.5x136	HSK 80
S-HSK 100-22x136	HSK 100



Tool Clamp

- No surface damage such as abrasion and scratch around taper shank closely associated with tool runout
- Easy to assemble and disassemble pull stud bolt
- Convenient and safe when using coolant tube wrench with milling chuck or ER collet chuck

Spindle Cleaners – Professional Series

These easy to use wipers clean your spindles assuring that toolholder tapers make continuous positive contact for repeatable on-center performance. The wiper can also be used for cleaning the bores of collet chucks and Morse Taper holders.

Catalog Number	Description
ISO30	30-Taper Spindle Clean equipped with cleaning blades
ISO40	40-Taper Spindle Clean equipped with cleaning blades
ISO50	50-Taper Spindle Clean equipped with cleaning blades

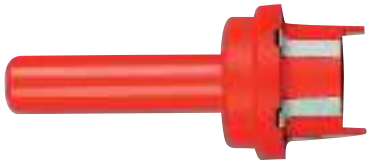
Taper Cleaners for HSK Tool Tapers

For cleaning HSK tool tapers. Plastic body with leather inserts.

For cleaning HSK tool tapers. Plastic body with leather inserts.

Catalog Number	HSK Form A/C/E
76.208.040	40
76.208.050	50
76.208.063	63

Taper Cleaners for HSK Spindles



For cleaning HSK spindle tapers. Plastic body with leather inserts.

Catalog Number	HSK Form A/C
76.205.032	32
76.205.040	40
76.205.050	50

■ Calculating Cutting Speed

(1) Calculating rotation speed from cutting speed

$$n = \frac{1{,}000 \times v_c}{\pi \times D_m}$$

n : Spindle Speed (min^{-1})
v_c : Cutting speed (m/min)
D_m : Inner/outer diameter of workpiece (mm)
π : π≈ 3.14

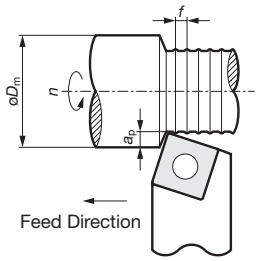
Example: v_c=150m/min, D_m=100mm

$$n = \frac{1{,}000 \times 150}{3.14 \times 100} = 478 \text{ (min}^{-1}\text{)}$$

(2) Calculating cutting speed from rotational speed

$$v_c = \frac{\pi \times D_m \times n}{1{,}000}$$

Refer to the above table



- n : Spindle speed (min^{-1})
- v_c : Cutting speed (m/min)
- f : Feed rate per revolution (mm/rev)
- a_p : Depth of cut (mm)
- D_m : Diameter of workpiece (mm)

■ Calculating Power Requirements

$$P_c = \frac{v_c \times f \times a_p \times k_c}{60 \times 10^3 \times \eta}$$

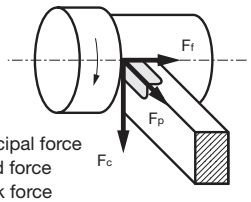
$$H = \frac{P_c}{0.75}$$

P_c : Power requirements (kW)
v_c : Cutting speed (m/min)
f : Feed Rate (mm/rev)
a_p : Depth of cut (mm)
k_c : Specific cutting force (MPa)
H : Required horsepower (HP)
η : Machine efficiency (0.70 to 0.85)

● Rough value of kc

Aluminum: 800MPa
General steel: 2,500 to 3,000MPa
Cast iron: 1,500MPa

■ Three cutting force components



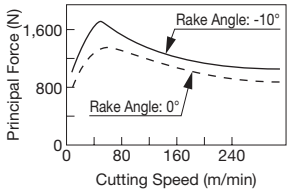
F_c : Principal force
F_f : Feed force
F_p : Back force

● Calculating cutting force

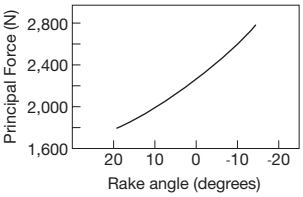
$$P = \frac{k_c \times q}{1{,}000} = \frac{k_c \times a_p \times f}{1{,}000}$$

P : Cutting force (kN)
k_c : Specific cutting force (MPa)
q : Chip area (mm^2)
a_p : Depth of Cut (mm)
f : Feed Rate (mm/rev)

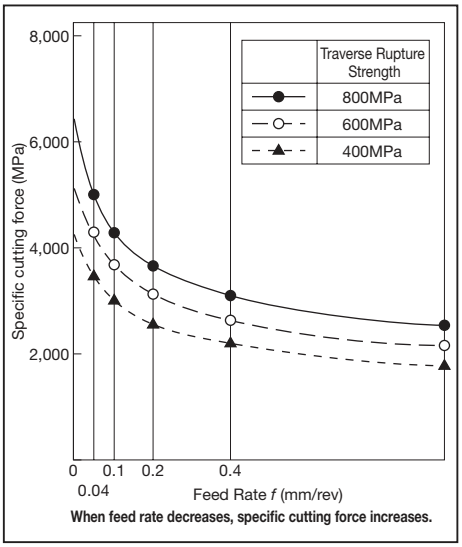
■ Relation between cutting speed and cutting force



■ Relation between rake angle and cutting force



■ Relation between feed rate and specific cutting force (for carbon steel)



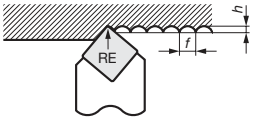
When feed rate decreases, specific cutting force increases.

■ Machined Surface Roughness

● Theoretical (geometrical) surface roughness

$$h = \frac{f^2}{8 \times RE} \times 10^3$$

h: Theoretical surface roughness (μm)
f : Feed rate per revolution (mm/rev)
RE: Nose radius (mm)



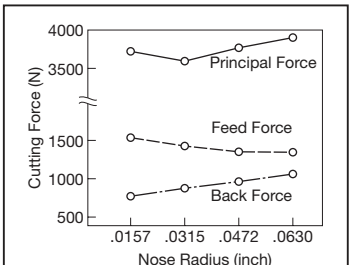
■ Actual surface roughness

Steel:
Theoretical surface roughness × 1.5 to 3
Cast iron:
Theoretical roughness × 3 to 5

● Ways to improve surface finish roughness

(1) Use an insert with a larger nose radius
(2) Optimise the cutting speed and feed rate so that built-up edges do not occur
(3) Select an appropriate insert grade
(4) Use wiper insert

■ Relation between nose radius and 3-part force

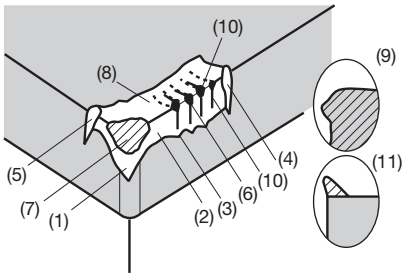


Large nose radius increases back force.

Part Material: Alloy Steel (38HS)
Insert: TNGA43○○
Holder: PTGNR2525-43
Cutting Conditions: v_c =330 SFM,
a_p =.157",
f =0.018 IPR

Forms of Tool Failure and Tool Life, Turning Edition

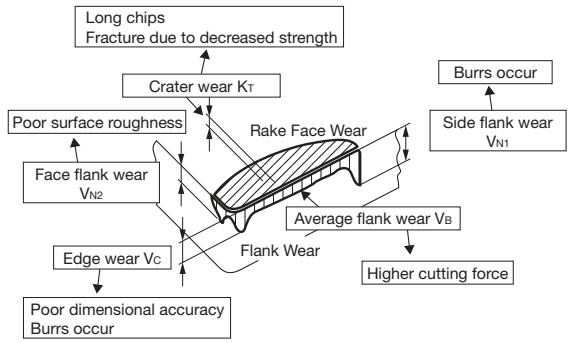
■ Forms of Tool Failure



Classification	No.	Name of Failure	Major Causes of Failure
Failure Caused by Mechanical Factors	(1) to (5)	Flank Wear	Wear caused by the scratching effect of hard grains contained in the work material
	(6)	Chipping	Fine breakages caused by high cutting loads or vibration
	(7)	Fracture	Large breakage caused by the impact of an excessive mechanical force acting on the cutting edge
Failure Caused by Thermal and Chemical Reactions	(8)	Crater wear	Cutting chips removing tool material as it flows over its top rake at high temperatures
	(9)	Plastic deformation	Deformation of cutting edge due to softening at high temperatures
	(10)	Thermal cracking	Fatigue from rapid, repeated heating and cooling cycles during interrupted cutting
	(11)	Built-up edges	Work material is pressure welded on the top face of the cutting edge

■ Tool Wear Curve

Forms of Tool Wear



Flank wear	Crater wear on rake face
	· Wear increases rapidly right after starting cutting, then moderately and proportionally, and then rapidly again after a certain value	· Wear increases proportionately to the cutting time

■ Tool Life (V-T)

· This double logarithm graph shows the relative tool life (T) with the specified wear over a range of cutting speeds (Vc) on the X axis, and the cutting speed along the Y axis

	Flank Wear	Crater wear
Tool wear		Tool life		
Cutting Edge Failure and Countermeasures, Turning Edition

■ Insert Failure and Countermeasures

Insert Failure	Cause	Countermeasures
Flank Wear 	· Tool grade lacks wear resistance · Cutting speed is too fast · Feed rate is far too slow	· Select a more wear-resistant grade P30→P20→P10 K20→K10→K01 · Increase rake angle · Decrease cutting speed · Increase feed rate
Crater Wear 	· Tool grade lacks crater wear resistance · Rake angle is too small · Cutting speed is too fast · Feed rate and depth of cut are too large	· Select a more crater wear-resistant grade · Increase rake angle · Change the chipbreaker of the insert · Decrease cutting speed · Reduce feed rate and depth of cut
Cutting Edge Chipping 	· Tool grade lacks toughness · Cutting edge breaks off due to chip adhesion · Cutting edge is not strong enough · Feed rate and depth of cut are too large	· Select a tougher grade P10→P20→P30 K01→K10→K20 · Increase amount of honing on cutting edge · Reduce rake angle · Reduce feed rate and depth of cut
Cutting Edge Fracture 	· Tool grade lacks toughness · Cutting edge is not strong enough · Holder is not strong enough · Feed rate and depth of cut are too large	· Select a tougher grade P10→P20→P30 K01→K10→K20 · Select an insert chipbreaker with a strong cutting edge · Select a holder with a larger approach angle · Select a holder with a larger shank size · Reduce feed rate and depth of cut
Adhesion/Built-up Edges 	· Inappropriate grade selection · Cutting edge is not sharp enough · Cutting speed is too slow · Feed rate is too slow	· Select a grade with less affinity to the work material Coated carbide or cermet grades · Select a grade with a smooth coating · Increase rake angle · Reduce honing · Increase cutting speed · Increase feed rate
Plastic Deformation 	· Tool grade lacks thermal resistance · Cutting speed is too fast · Feed rate and depth of cut are too large · Not enough coolant	· Select a more crater wear-resistant grade · Increase rake angle · Decrease cutting speed · Reduce feed rate and depth of cut · Supply sufficient coolant
Notch Wear 	· Tool grade lacks wear resistance · Rake angle is too small · Cutting speed is too fast	· Select a more wear-resistant grade P30→P20→P10 K20→K10→K01 · Increase rake angle · Alter depth of cut to shift the notch location

Chip Control and Countermeasures, Turning Edition

■ Type of Chip Generation

	Flowing	Shearing	Tearing	Cracking
Type				
Condition	Continuous chips with good surface finish	Chip is sheared and separated by the shear angle	Chips appear to be torn from the surface	Chips crack before reaching the cutting point
Application	General cutting of steel and light alloy	Steel, stainless steel (low speed)	Steel, cast iron (very low speed, very small feed rate)	Cutting of general cast iron and carbon
Influence factor	Large ← Deformation of work material → Small Large ← Rake angle → Small Small ← Depth of cut → Large Large ← Cutting speed → Small			

■ Type of Chip Control

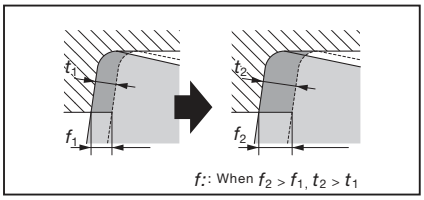
	Depth of cut	A	B	C	D	E
Classification of chip shapes	Large					
	Small					
Evaluation	NC lathe (for automation)	×	×	○	○	△
	General-purpose lathe (for safety)	×	○	○	○ to △	×

Good: C type, D type

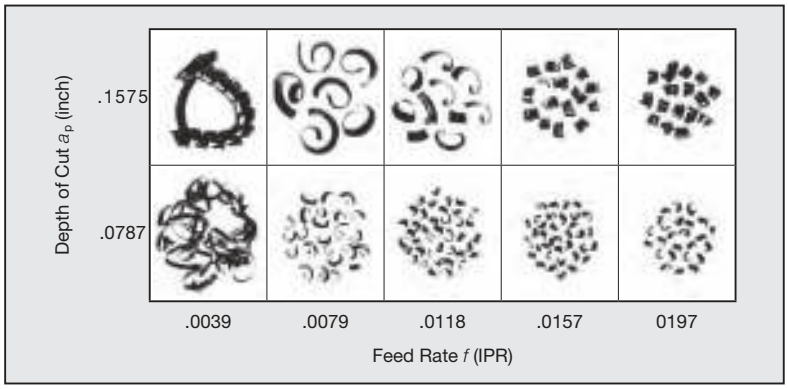
Poor
- A type: Twines around the tool or workpiece, damaging the machined surface and affecting safety
- B type: Causes problems in the automatic chip conveyor and chipping occurs easily
- E type: Causes spraying of chips and poor surface finish due to chattering, along with chipping, large cutting force and high temperatures

■ Factor of Improvement of Chip Control

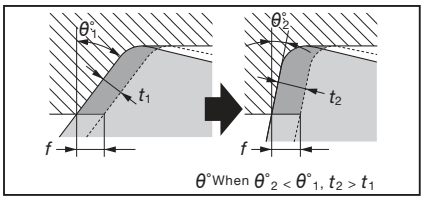
(1) Increase feed rate (*f*)



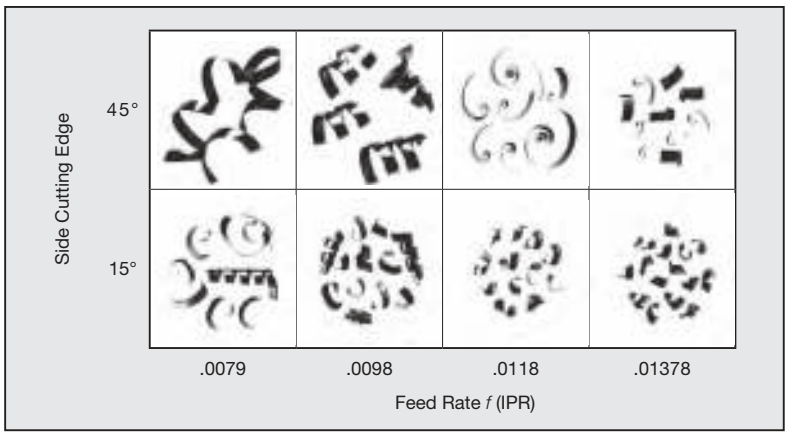
When the feed rate increases, the chip thickness (t) increases and chip control improves.



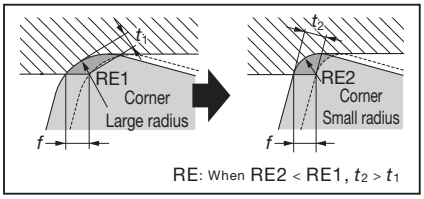
(2) Decrease side cutting edge (θ°)



Even if the feed rate is the same, a smaller side cutting edge angle makes chips thicker and chip control improves.



(3) Reduce nose radius (RE)



Even if the feed rate is the same, a smaller nose radius makes chips thicker and chip control improves.

* Cutting force increases proportionately to the length of the contact surface. Therefore, a larger nose radius increases back force which induces chattering. A smaller nose radius produces a rougher surface finish at the same feed rate.

The Basics of Threading, Turning Edition

■ Thread Cutting Methods

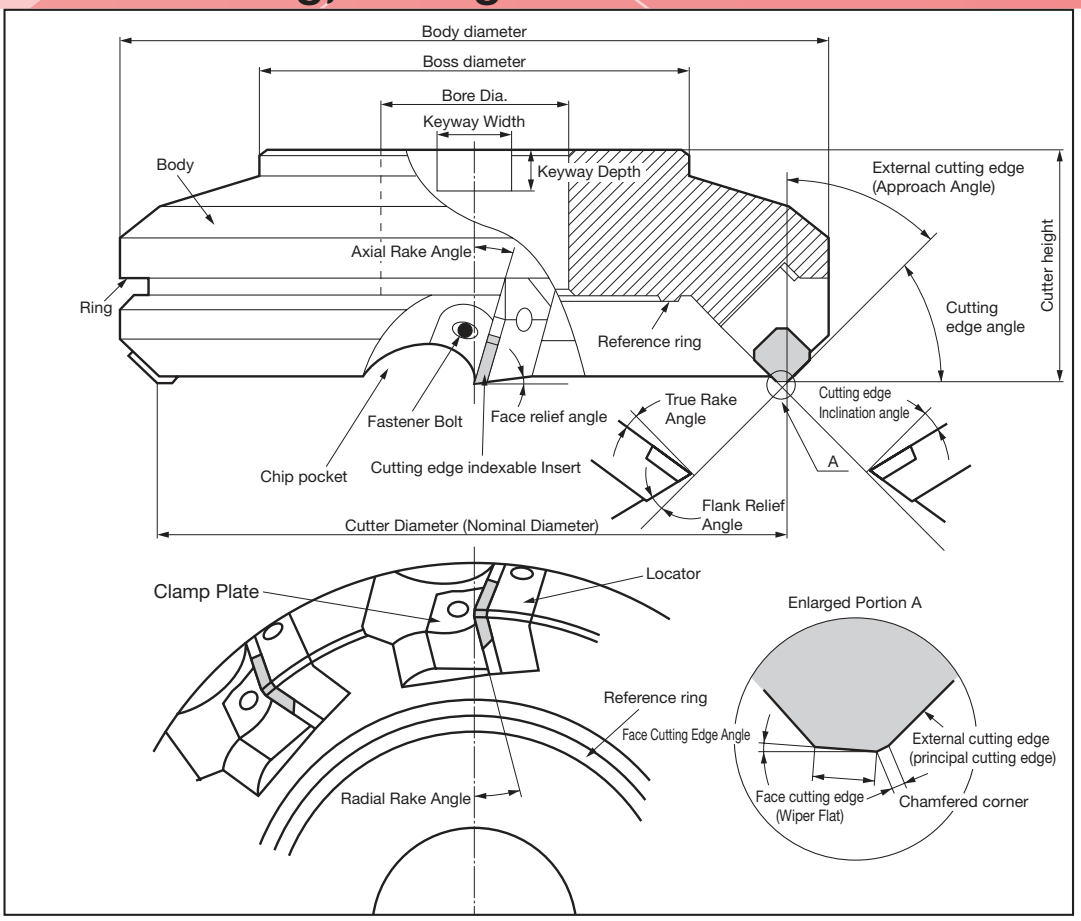
Cutting Method	Features
Radial Infeed 	· Most common threading technique, used mainly for small pitch threads. · Easy to change cutting conditions such as depth of cut, etc. · Long contact point has a tendency to chatter. · Chip control is difficult. · Considerable damage tends to occur on the trailing edge side.
Flank Infeed 	· Effective for large-pitch threads and blemish-prone work material surfaces. · Chips evacuate from one side for good chip control. · The trailing edge side is worn, and therefore the flank is easily worn.
Modified Flank Infeed 	· Effective for large-pitch threads and blemish-prone work material surfaces. · Chips evacuate from one side for good chip control. · Inhibits flank wear on trailing edge side.
Alternating Flank Infeed 	· Effective for large-pitch threads and blemish-prone work material surfaces. · Wears evenly on right and left cut edges. · Since both edges are used alternately, chip control is sometimes difficult.

■ Troubleshooting for Threading

	Failure	Cause	Countermeasures
Cutting Edge Damage	Excessive Wear	· Tool grade	· Select a more wear-resistant grade
		· Cutting conditions	· Reduce cutting speed · Use a suitable quantity and concentration of coolant · Change the number of passes
	Uneven Wear on Right and Left Sides	· Tool mounting	· Check whether the cutting edge inclination angle is appropriate for the thread lead angle · Check whether the tool is mounted properly
		· Cutting conditions	· Change to modified flank infeed or alternating flank infeed
	Chipping	· Cutting conditions	· If built-up edge occurs, increase the cutting speed
	Breakage	· Biting of chips	· Supply enough coolant to the cutting edge
		· Cutting conditions	· Increase the number of passes and reduce the depth of cut for each pass · Use separate tools for roughing and finishing
Shape and Accuracy	Poor Surface Roughness	· Cutting conditions	· If blemished due to low-speed machining, increase the cutting speed · If chattering occurs, decrease the cutting speed · If the depth of cut of the final pass is too small, make it larger
		· Tool grade	· Select a more wear-resistant grade
		· Inappropriate cutting edge inclination angle	· Select the correct shim to ensure relief on the side of the insert
	Inappropriate Thread Shape	· Tool mounting	· Check whether the tool is mounted properly
	Shallow Thread Depth	· Shallow depth of cut	· Check the depth of cut
		· Tool wear	· Check damage to the cutting edge

The Basics of Milling, Milling Edition

■ Parts



■ Milling Calculation Formulas

● Calculating cutting speed

$$v_c = \frac{\pi \times DC \times n}{1{,}000}$$

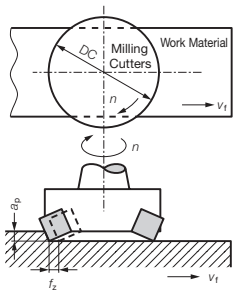
$$n = \frac{1{,}000 \times v_c}{\pi \times DC}$$

● Calculating feed rate

$$v_f = f_z \times z \times n$$

$$f_z = \frac{v_f}{z \times n}$$

v_c : Cutting speed (m/min)
π : $\pi \approx 3.14$
DC : Nominal cutting diameter (mm)
n : Rotation speed (min^{-1})
v_f : Feed rate per minute (mm/min)
f_z : Feed rate per tooth (mm/t)
z : Number of teeth



● Calculating power requirements

$$P_c = \frac{a_e \times a_p \times v_f \times k_c}{60 \times 10^6 \times \eta} = \frac{Q \times k_c}{60 \times 10^3 \times \eta}$$

P_c: Power consumption (kw)
H : Required horsepower (HP)
Q : Chip evacuation amount (cm^3/min)
a_e: Cutting width (mm)
v_f : Feed rate per minute (mm/min)
a_p: Depth of cut (mm)
k_c : Cutting force (MPa)
Rough values (Steel: 2,500 to 3,000MPa / Cast iron: 1,500MPa / Aluminum: 800MPa)
η : Machine efficiency (about 0.75)

● Horsepower requirements

$$H = \frac{P_c}{0.75}$$

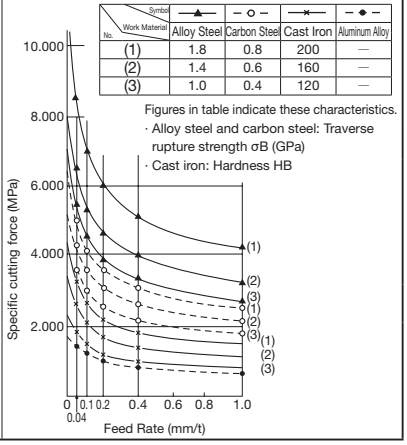
● Chip evacuation amount

$$Q = \frac{a_e \times a_p \times v_f}{1{,}000}$$

● Relation between feed rate, work material and specific cutting force

No. \ Work Material	Alloy Steel	Carbon Steel	Cast Iron	Aluminum Alloy
(1)	1.8	0.8	200	—
(2)	1.4	0.6	160	—
(3)	1.0	0.4	120	—

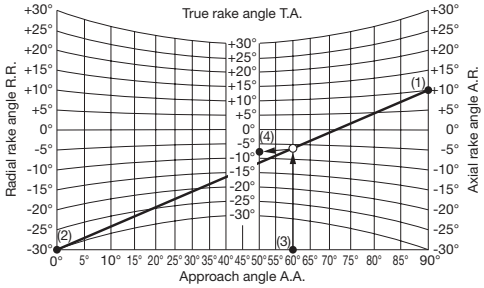
Figures in table indicate these characteristics.
· Alloy steel and carbon steel: Traverse rupture strength σB (GPa)
· Cast iron: Hardness HB



■ Functions of cutting edge angles

	Material	Symbol	Function	Effect
(1) (2)	Axial rake angle Radial rake angle	A.R. R.R.	Determines chip evacuation direction, adhesion, thrust, etc.	Available in positive to negative (large to small) rake angles. Typical combinations: Positive and Negative, Positive and Positive, Negative and Negative
(3)	Approach angle	A.A.	Determines chip thickness and chip evacuation direction	Large: Thin chips Small cutting force
(4)	True rake angle	T.A.	Effective rake angle	Positive (Large): Excellent machinability and low chip adhesion. Low cutting edge strength Negative (Small): Strong cutting edge and easy chip adhesion
(5)	Cutting edge inclination angle	I.A.	Determines chip control direction	Positive (Large): Excellent chip control and small cutting force. Low cutting edge strength
(6)	Face cutting edge angle	F.A.	Determines surface finish roughness	Small: Excellent surface roughness
(7)	Relief angle		Determines cutting edge strength, tool life, chattering	

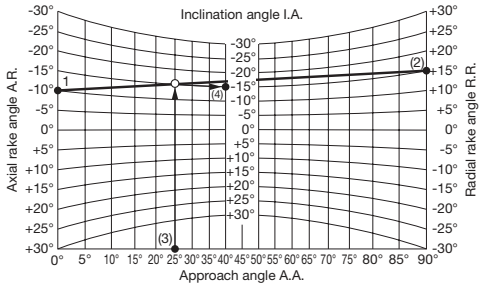
True rake angle (T.A.) table



Example: (1) A.R. (Axial rake angle) = +10°
(2) R.R. (Radial rake angle) = -30°
(3) A.A. (Approach angle) = 60°
-> (4) T.A. (True rake angle) = -8°

Formula: tan T.A.=tan R.R./cos A.A. + tan A.R./sin A.A.

Inclination angle (I.A.) chart



Example: (1) A.R. (Axial rake angle) = -10°
(2) R.R. (Radial rake angle) = +15°
(3) A.A. (Approach angle) = 25°
-> (4) I (inclination angle) = -15°

Formula: tan I.R.=tan A.R./cos A.A. - tan R.R./sin A.A.

■ Rake angle combination and features

	Double Positive type	Negative - Positive type	Double Negative type
Edge combination and chip evacuation A.R.: Axial rake angle R.R : Radial rake angle A.A.: Approach angle : Chip and evacuation direction : Cutter rotation direction			Advantages	Good sharpness	Excellent chip evacuation and sharpness	Economical design enabling use of both sides of insert Strong cutting edge
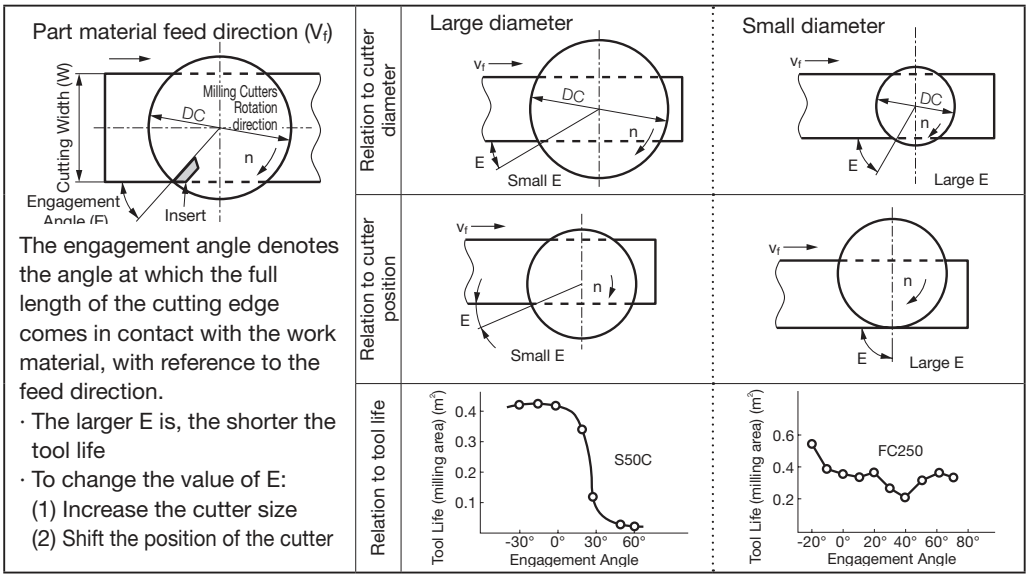
Disadvantages	Only single-sided inserts with a lower cutting edge strength can be used	Only single-sided inserts can be used	Dull cutting action
Applications	Machining of aluminum alloy and other materials requiring sharpness	Machining of steel, cast iron, and stainless steel, with suitable strength and good evacuation	For hard materials such as cast iron or poor surfaces such as castings
Cat. No.	ALNEX, WEZ, HF, WAX	WGX, WFX, RSX, MSX	TSX, DGC, DFC, DNX
Chips (Ex.) Part material: Alloy Steel · v_c=430 SFM f_z =.009 in./t a_p=.118”			

■ Relation between engagement angle and tool life

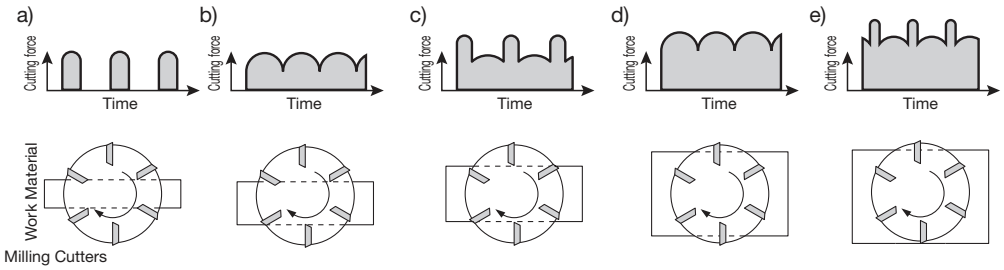


The engagement angle denotes the angle at which the full length of the cutting edge comes in contact with the work material, with reference to the feed direction.

- The larger E is, the shorter the tool life
- To change the value of E:
  (1) Increase the cutter size
  (2) Shift the position of the cutter

● Relation between the number of simultaneously engaged cutting edges and cutting force

Normally, a cutting width 70 to 80% of the cutter diameter is considered appropriate, as shown in example d). However, this may not apply due to the actual rigidity of the machine or workpiece, and the machine horsepower.



- a) · 0 or 1 edge in contact at same time
- b) · Only 1 edge in contact at any time
- c) · 1 or 2 edges in contact
- d) · 2 edges in contact at any time
- e) · 2 to 3 edges in contact

■ Improving surface roughness

(1) Inserts with wiper flat

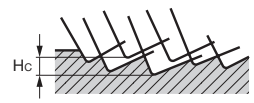
When all of the cutting edges have wiper flats, a few teeth protrude due to inevitable runout and act as wiper inserts.

- Insert equipped with straight wiper flat
  (Face angle: Around 15' to1°)
- Insert equipped with curved wiper flat
  (Curvature: ≈ R500 (example))

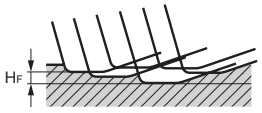
(2) Wiper insert assembling system

A system in which one or two inserts (wiper inserts) protrude with a smooth curved edge just a little beyond the other teeth to wipe the milled surface. (Applicable to WGX Type, DGC Type, etc.)

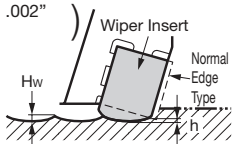
● Surface roughness without wiper flat



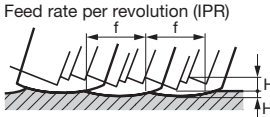
● Surface roughness with straight wiper flat



h: Projection value of wiper insert
(Cast Iron: .002"
Al: .001")

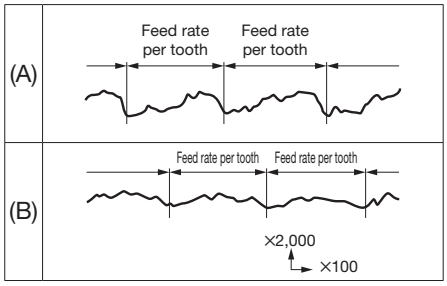


f: Feed rate per revolution (IPR)



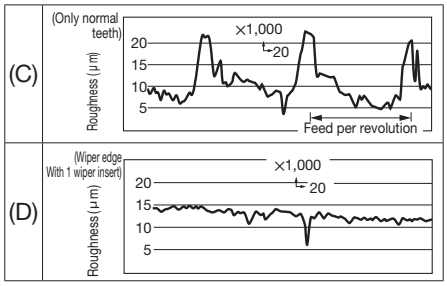
Hc: Surface roughness with only normal teeth
Hw: Surface roughness with wiper insert

● Surface roughness with wiper edge (difference in face cutting edge)



- · Part material: Alloy Steel
- · Cutter: DPG5160R (per tooth)
- · v_c = 510 SFM
  f_z = .0092 in./t
  a_p = .0787"
- · Face Cutting Edge Angle
  (A): 28'
  (B): 6'

● Effects of wiper insert (example)



- · Part material: Grey Cast Iron
- · Cutter: DPG4100R
- · Insert: SPCH42R
- · Face runout: .0006"
- · Runout: .0016"
- v_c = 350 SFM
  f_z = .0571 IPR
- (C): Normal teeth
- (D): Per wiper edge

Troubleshooting for Milling, Milling Edition

■ Horsepower Consumption

This section contains the horsepower consumption formula and the explanation of the associated variables. A list of commonly encountered materials has been added to assist you when determining the required horsepower for a machining operation.

Machine efficiency, drive type, and amount of time that the machine has been running can effect the horsepower and torque availability at the spindle. Without an extensive list of specifications, it is nearly impossible to predict the capabilities of a machine tool. Sumitomo suggests that unless the capabilities of a machine tool are well known, it is wise to limit the attempted operations to those that require no more than 65% of the machine's rated horsepower.

Please take the time to understand the power requirements of an operation before attempting it, unless you are very familiar with the tool, material, and especially the machine being used.

*Note: If the material that you are machining is not found in this list, contact the material manufacturer for further information. Most material suppliers, or mills, have excellent technical resources available. However, if the material in question exhibits machining properties that are similar to a given material, use the corresponding "K" factor.

■ Horsepower Consumption Formula

$$\text{Horsepower} = \frac{W \times D \times F}{K}$$

W = width of cut (inches)
D = depth of cut (inches)
F = feed rate (inches/minute)
K = 'K' factor for material

'K' factors for some common materials are:

Material	'K'
Magnesium	4.0
Aluminum	4.0
Copper	2.0
Brass	2.5
Bronze	2.0
Malleable iron	1.0
Cast iron	
Ferrite	1.5
Pearlitic	1.0
Chilled	.6
Steel	
up to 150 BHN	1.0
up to 300 BHN	.8
up to 400 BHN	.5
up to 500 BHN	.4

Material	'K'
Stainless steel	
Free machining	1.0
Others	.6
Titanium	
under 100,000 psi	.8
100,000-135,000 psi	.6
135,000 psi and over	.4
High-tensile alloys	
180,000-220,000 psi	.5
220,000-260,000 psi	.4
260,000-300,000 psi	.3
High-temperature alloys	
Nickel base alloys	.4
Cobalt base alloys	.4
Austenitic alloys	.4

■ Lead Angle Effect

The lead angle effect is a commonly known phenomenon in tool design. As the lead angle of a tool (the angle at which the insert is rotated away from its axial center line) increases, the actual thickness of the produced chip decreases from the programmed amount. This allows us to take advantage of increased feed rates over standard zero degree (90 degree shoulder) lead tools.

By comparing the following lead angle figures, it is possible to increase the actual feed rate up to 30% over the suggested numbers (depending on the type of tool), thus increasing productivity.

Tool Lead Angle	% of chip thickness from programmed feed rate
15 degrees	96%
20 degrees	94%
30 degrees	86%
45 degrees	71%

To simplify this calculation we have included a chart that allows easy determination of programmed feed per tooth by choosing desired feed per tooth and then following the column down to the row that matches the lead angle of the tool that is being used.

Example: Find the programmed feed per tooth for a UFO cutter (45 degree lead angle), when the desired feed per tooth is 0.006 IPT.

Answer: Programmed feed per tooth = 0.0085 IPT

■ Programmed Feed Per Tooth vs. Desired Feed Per Tooth

Tool Lead Angle	Desired Feed Per Tooth (IPT)								
	0.004	0.005	0.006	0.007	0.008	0.009	0.010	0.011	0.012
	Programmed Feed Per Tooth (IPT)								
15	0.0042	0.0052	0.0063	0.0073	0.0083	0.0094	0.0104	0.0115	0.0125
20	0.0043	0.0053	0.0064	0.0074	0.0085	0.0096	0.0106	0.0117	0.0128
30	0.0047	0.0061	0.0070	0.0081	0.0093	0.0105	0.0116	0.0128	0.0140
45	0.0057	0.0075	0.0085	0.0099	0.0113	0.0127	0.0141	0.0156	0.0170

▲ mark: To be replaced by a new product, made to order or discontinued (please confirm stock availability)

■ Radial Chip Thinning

Just as the axial rake of a cutting tool can alter the actual chip thickness, so can radial chip thinning. This occurs whenever the radial width of cut is less than 1/2 the cutter diameter. This is commonly found when making periphery cuts while end milling.

Since both tool life and productivity rely on maintaining full chip thickness, it is important to compensate for this scenario. Rather than using the mathematical process to arrive at a *programmed feed rate*, we have included the following chart.

To use this chart it is necessary to have the following information:

1) Desired feed per tooth (as taken from the end mill speed and feed section)
2) Cutter diameter
3) Radial width of cut

The first step is to divide the radial width of cut by the cutter diameter and find the closest value in the first column on the left. Next find the *desired feed per tooth* at the top of the chart and follow that column down to the row that was found in the first step. This will be the *programmed feed per tooth*.

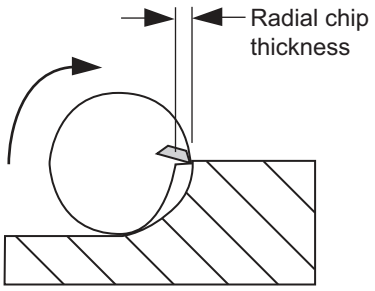
Example: 1.00″ diameter end mill
0.020″ radial width of cut
0.004″ *desired feed per tooth*

Answer: Dividing 0.020″ by 1.00″=0.020

Finding 0.020 in the first column on the left, and then the 0.004″ desired feed per tooth at the top, we find where the two meet and obtain 0.014″ *programmed feed per tooth*.

This results in a large increase in the feed rate. If we use these factors for a four flute tool at 2292 RPM, we have a feed rate of 128 IPM (2292 RPM x 0.014 IPT x 4 Flutes) versus 37 IPM (2292 RPM x 0.004 IPT x 4 Flutes) that might have otherwise been programmed.

As you can see from the illustration below, as radial depth increases, so does chip thickness until we reach 50% of the cutting diameter. At this point we have full, programmed chip load.



■ Radial Chip Thinning Compensation

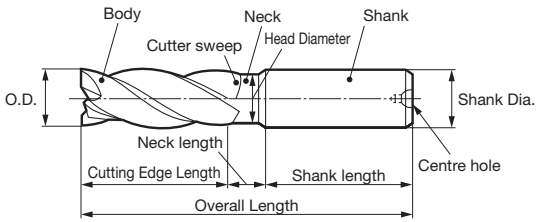
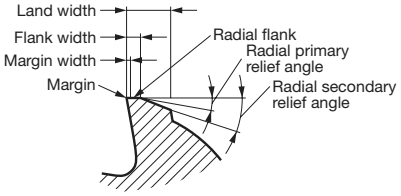
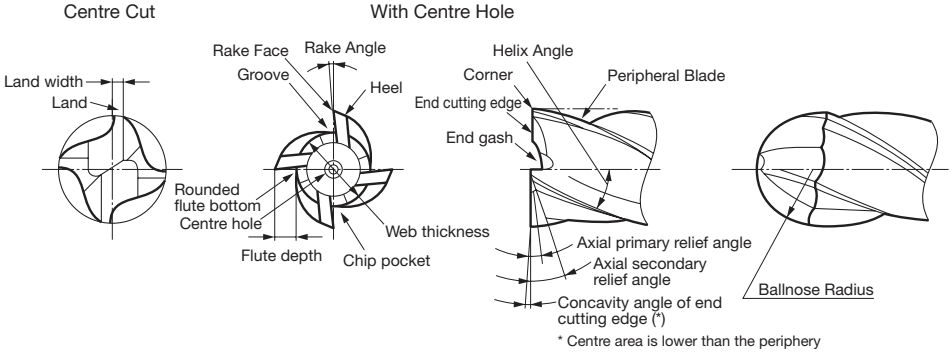
The Basics of Endmilling, Endmilling Edition

■ Parts



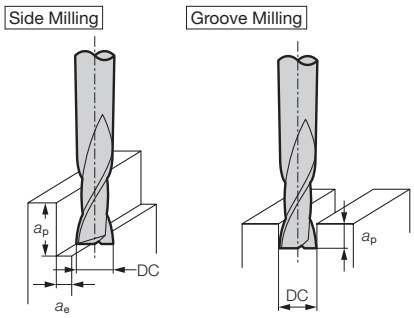




■ Calculating cutting conditions (square endmill)

● Calculating cutting speed

$$v_c = \frac{\pi \times DC \times n}{1{,}000} \qquad n = \frac{1{,}000 \times v_c}{\pi \times DC}$$



● Calculating feed rate per revolution and per tooth

$$v_f = n \times f \qquad f = \frac{v_f}{n}$$

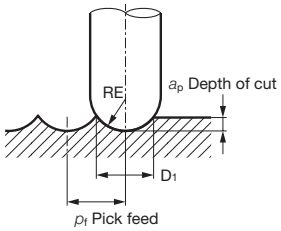
$$v_f = n \times f_z \times z \qquad f_z = \frac{f}{z} = \frac{v_f}{n \times z}$$

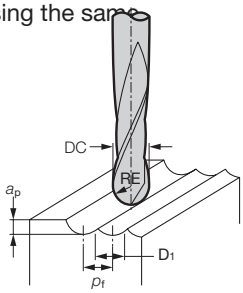
(Ballnose Endmill)

● Calculating notch width (D_1)

$$D_1 = 2 \times \sqrt{2 \times RE \times a_p - a_p^2}$$

●Cutting speed and feed rate (per revolution and per tooth) are calculated using the same formula as the square endmill.

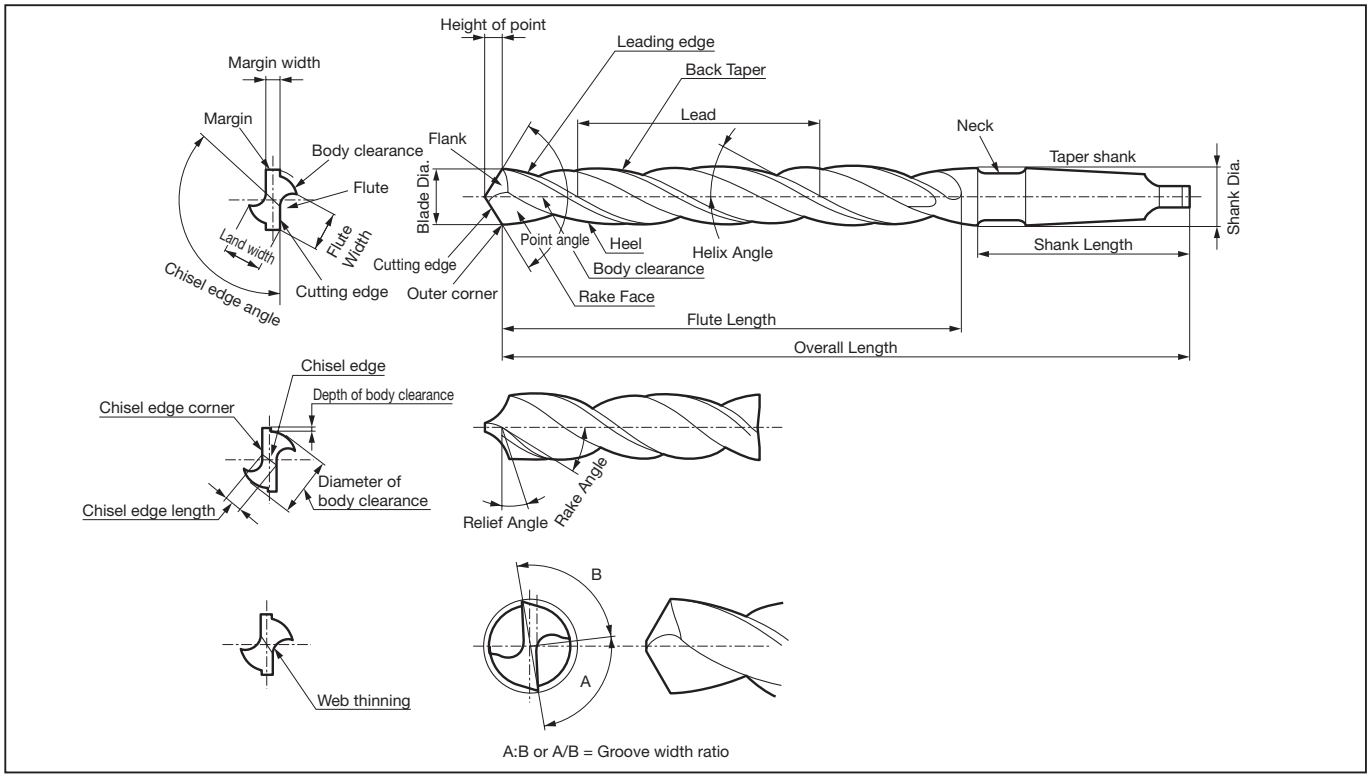




v_c : Cutting speed (m/min)
π : $\pi \approx 3.14$
DC : Endmill diameter (mm)
n : Spindle speed (min^{-1})
v_f : Feed rate (mm/min)
f : Feed rate per revolution (mm/rev)
f_z : Feed rate per tooth (mm/t)
z : Number of teeth
a_p : Depth of cut in axial direction (mm)
a_e : Depth of cut in radial direction (mm)
RE : Ballnose radius

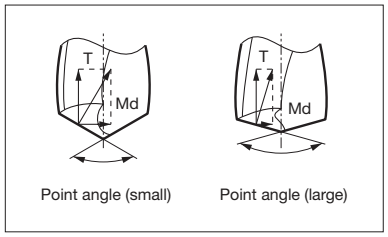
Basics of Drilling, Drilling Edition

■ Parts of Drill



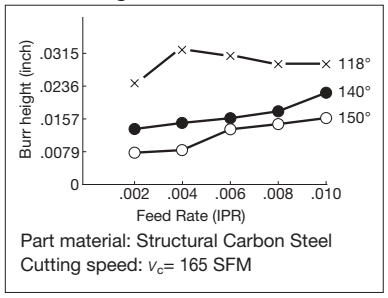
A:B or A/B = Groove width ratio

● Point angle and force



When point angle is large, thrust increases but torque decreases.

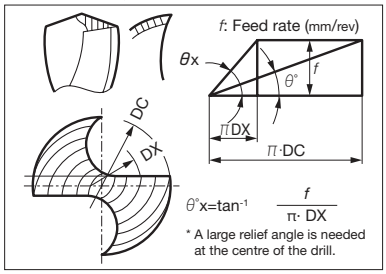
● Point angle and burr



Part material: Structural Carbon Steel
Cutting speed: v_c= 165 SFM

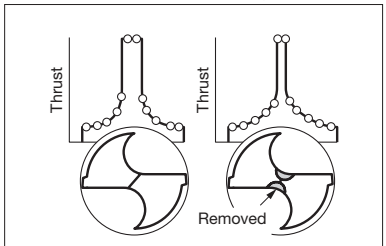
When point angle is large, burr height becomes low.

● Minimum requirement relief angle for drilling



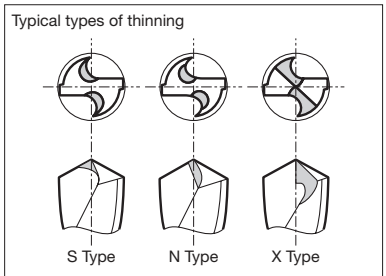
* A large relief angle is needed at the centre of the drill.

● Effects of web thinning



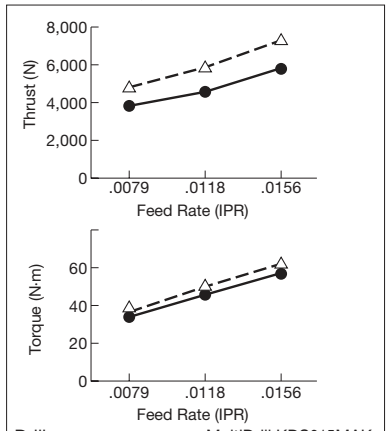
Web thinning decreases the thrust concentrated at the chisel edge, makes the drill edge sharp, and improves chip control.

● Chisel width decreased by thinning



S Type: Standard type used for general purposes.
N Type: Suitable for thin web drills.
X Type: For hard-to-cut materials or deep hole drilling. Entry easier.

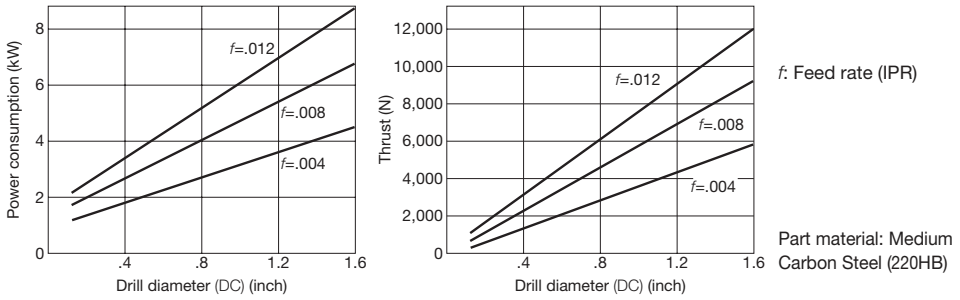
● Relation between edge treatment and cutting force



Drill : MultiDrill KDS215MAK
Edge treatment width : ●.0059”
△→.0091”
Part material : Carbon Steel (230HB)
Cutting conditions : v_c= 165 SFM, wet

Basics of Drilling, Drilling Edition

■ Reference of Power Requirements and Thrust



f: Feed rate (IPR)

Part material: Medium Carbon Steel (220HB)

■ Cutting Condition Selection

● Control cutting force for low-rigidity machines

The following table shows the relation between edge treatment width and cutting force. If the cutting force is too great and causes issues, take measures such as reducing the feed rate or reducing the cutting edge treatment of the drill.

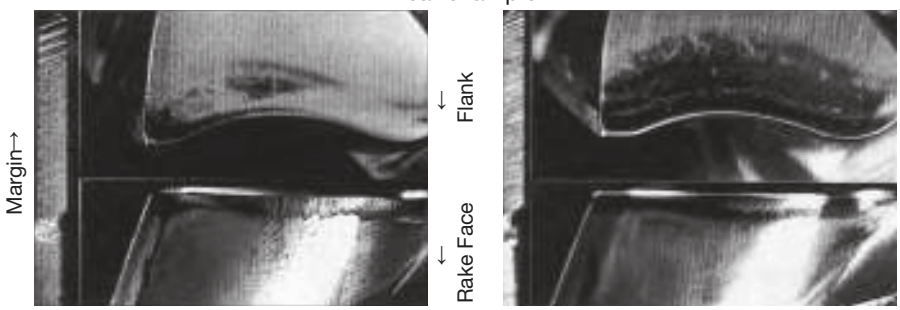
Cutting Conditions		Edge treatment width			
		.0059"		.0019"	
v_c(SFM)	*f* (IPR)	Torque (N/m)	Thrust (N)	Torque (N/m)	Thrust (N)
130	.015	12.8	2,820	12.0	2,520
165	.012	10.8	2,520	9.4	1,920
200	.009	9.2	2,320	7.6	1,640
200	.006	6.4	1,640	5.2	1,100

Drill Diameter : ø.394"
Part material : Carbon Steel (230HB)

● High speed machining recommendation

If the machine has enough power and sufficient rigidity, reasonable tool life can be ensured even when adopting higher efficiency machining; however, sufficient coolant must be supplied.

Wear example

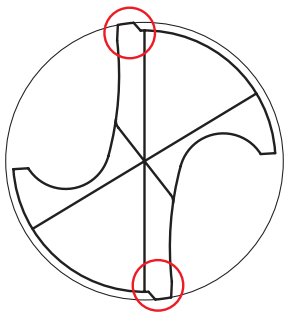


v_c= 200 SFM v_c= 400 SFM

Part material : Carbon Steel (230HB)
Cutting conditions: *f* = .0118 IPR
H=50mm
Tool life : 600 holes (Cutting length: 1.181")

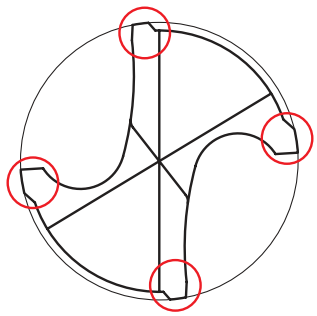
■ Explanation of Margins (Difference between single and double margins)

● Single Margin (2 guides: ○ part)



● Shape used on most drills

● Double Margin (4 guides: ○ part)

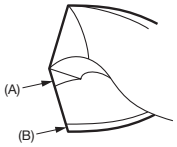


● 4-point guiding reduces hole bending and undulation for improved stability and accuracy during deep hole drilling.

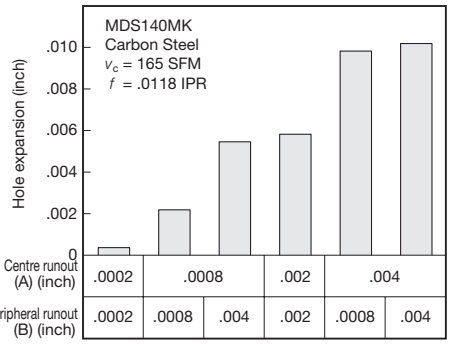
Basics of Drilling, Drilling Edition

■ Runout Accuracy

For the runout accuracy of web-thinned drills, the runout after thinning (A) is important in addition to the difference in lip height (B).



(A): Runout accuracy of thinning point
(B): The difference of the lip height

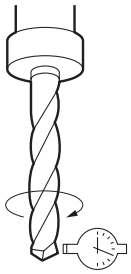


Centre runout (A) (inch)	.0002	.0008		.002	.004	
Peripheral runout (B) (inch)	.0002	.0008	.004	.002	.0008	.004

■ Drill Mounting Peripheral Runout Accuracy

• When the tool rotates

The peripheral runout accuracy of the drill mounted on the spindle should be controlled within .0012". If the runout exceeds the limit, the drilled hole will also become large and an increase in the horizontal cutting force, which may result in drill breakage.



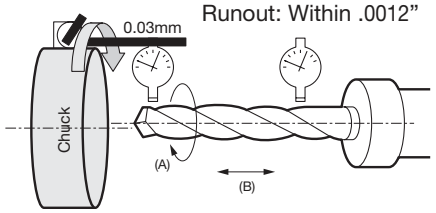
Runout: Within .0012"

Peripheral runout (inch)	Hole expansion 0 .002 (in.)	Cutting Force* 0 22 (lbs)
.0002		
.0035		

* Horizontal cutting force.
Drill: MDS120MK, part material: Carbon Steel (230HB)
Cutting Conditions: v_C= 165 SFM, f = .0118 IPR, H = 1.50"
Water-soluble Coolant

• When the part material rotates

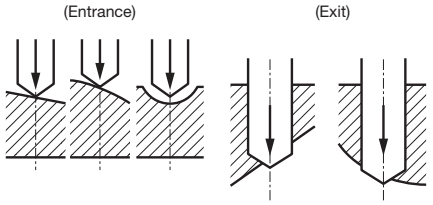
The peripheral runout at the drill edge (A) and the concentricity at (B) should be controlled within .0012".



■ Work Material Surface and Drill Performance

• Part material with slanted or uneven surface

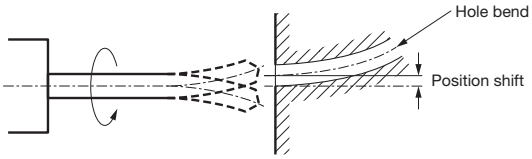
If the surface of the hole entrance or exit is slanted or uneven, decrease the feed rate to 1/3 to 1/2 of the recommended cutting conditions.



■ How to Use a Long Drill

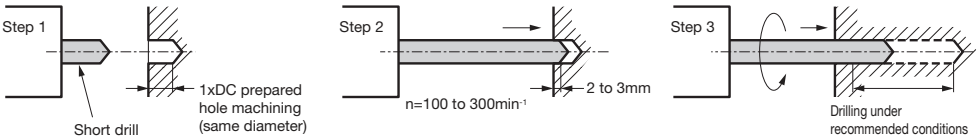
• Problem

When using a long drill (e.g. XHGS Type), SMDH-D Type drill or SMDH-12.5D Type drill at high rotation speeds, the runout of the drill tip may cause a deviation of the entry point as shown on the right, bending the drill hole and resulting in drill breakage.

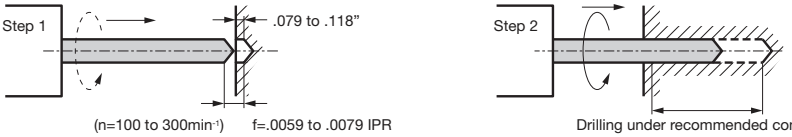


• Remedies

Method 1



Method 2 *Low rotational speed minimises centrifugal forces and prevents the drill from bending.

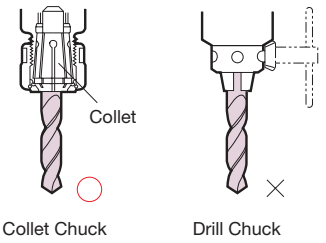


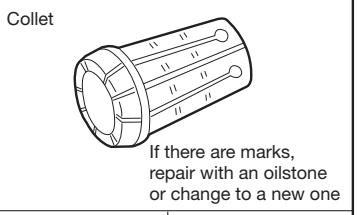
MultiDrill Usage Guidance, Drilling Edition

■ Drill Maintenance

(1) Collet Selection and Maintenance

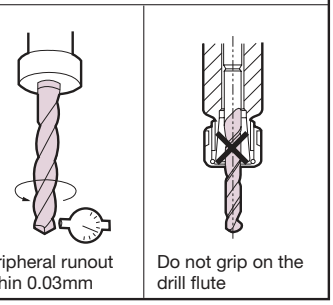
- Ensure proper chucking of drills to prevent vibration. Collet type chucks are recommended, as the grip is strong and can be used with ease.
  (Drill chucks and keyless chucks are not suitable for MultiDrills as they have a weaker grip force.)
- When replacing drills, regularly remove cutting chips inside the collet by cleaning the collet and the spindle with oil. Repair marks with an oilstone.





(2) Drill Mounting

- The peripheral runout of the drill mounted on the spindle must be within 0.03mm.
- Do not chuck on the drill flute.
  (If the drill flute is inside the holder, chip evacuation will be obstructed, causing damage to the drill.)



■ Using Cutting Oil

(1) Choosing Cutting Oil

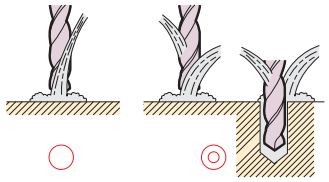
- If the cutting speed is more than 40m/min, cutting oil (JISW1 type 2) is recommended as its cooling effects and chip control capacity are good, and it is highly soluble.
- For optimum tool life at cutting speeds of less than 40m/min, sulfo-chlorinated oil (JISA1 type 1) is recommended as it has a lubricating effect and is non-water soluble. * Insoluble cutting oil may be flammable. To prevent fire, a substantial amount of oil should be used to cool the component so that smoke and heat will not be generated.

(2) Supply of Coolant

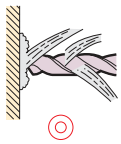
- External Coolant Supply
  There must be a sufficient external supply of coolant at the hole position. Coolant pressure 0.3 to 0.5MPa, coolant volume 3 to 10M/min is a guideline.
- Internal Coolant Supply
  For holes ø4 or smaller, the oil pressure must be at least 1.5MPa to ensure a sufficient supply of coolant. For ø6 and above, if L/D is <3, the pressures should be at 0.5 to 1.0MPa. If L/D is >3, a hydraulic pressure of at least 1 to 2MPa is recommended.

● External Coolant Supply

● Vertical drilling

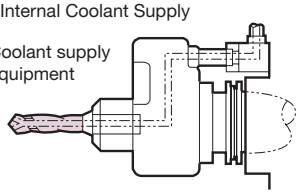


● Horizontal drilling

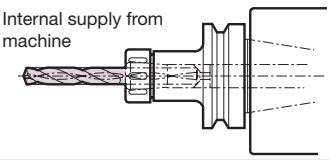


● Internal Coolant Supply

● Coolant supply equipment



● Internal supply from machine

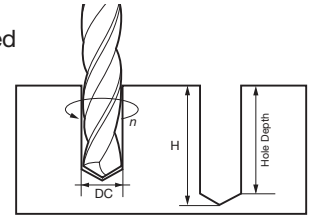


■ Calculation of Power Consumption and Thrust

- Calculating cutting speed

$$v_c = \frac{\pi \times DC \times n}{1{,}000}$$

$$n = \frac{1{,}000 \times v_c}{\pi \times DC}$$



- Calculating feed rate per revolution and per tooth

$$v_f = n \times f \qquad f = \frac{v_f}{n}$$

- Calculation of Cutting Time

$$T = \frac{H}{v_f}$$

v_c : Cutting speed (m/min)
π : π≈3.14
DC : Drill diameter (mm)
n : Rotation speed (min^{-1})
v_f : Feed rate (mm/min)
f : Feed rate per revolution (mm/rev)
H : Drilling depth (mm)
T : Cutting time (min)
HB : Work material Brinell hardness

- Calculation of Power Consumption and Thrust

<Experimental>

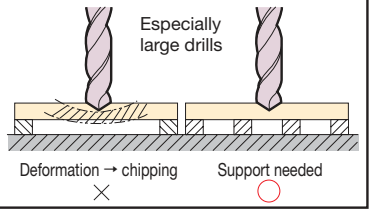
Power consumption (kW) = $HB \times DC^{0.68} \times v_c^{1.27} \times f^{0.59} / 36{,}000$

Thrust (N) = $0.24 \times HB \times DC^{0.95} \times f^{0.61} \times 9.8$

* When designing the machine, an allowance of 1.6 x power consumption and 1.4 x thrust should be given.

■ Clamping of the Workpiece

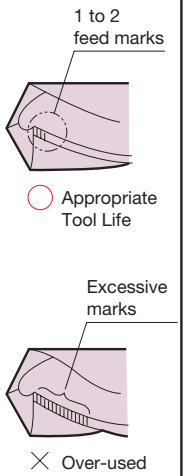
High thrust forces occur during high-efficiency drilling. Therefore, the workpiece must be supported to prevent fractures caused by deformation. Large torques and horizontal cutting forces also occur. Therefore, the workpiece must be clamped firmly enough to withstand them.



■ Drill Regrinding

- When to regrind
  When one or two feed marks (lines) appear on the margin, when corner wear reaches the margin width or when small chipping occurs, it indicates that the drill needs to be sent for regrinding.
- How and where to regrind
  We recommend regrinding and recoating. Regrinding alone may be sufficient, but if the work material is steel, use recoating as well as regrinding to prevent shortening of tool life. Note: Ask us or an approved vendor to recoat with our proprietary coating.
- Regrinding on your own
  Customers regrinding their own drills can obtain MultiDrill Regrinding Instructions from us directly or their vendor.

● Tool life determinant



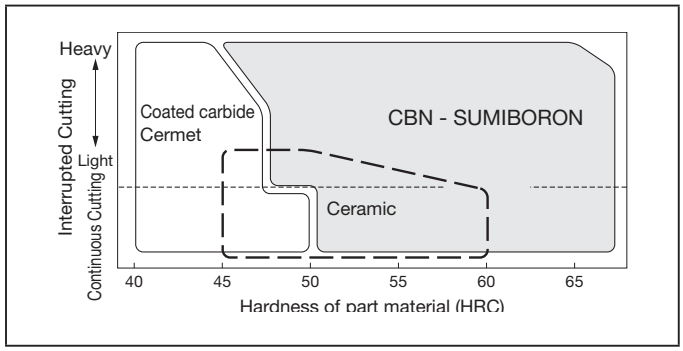
Troubleshooting for Drilling, Drilling Edition

■ Troubleshooting for Drilling

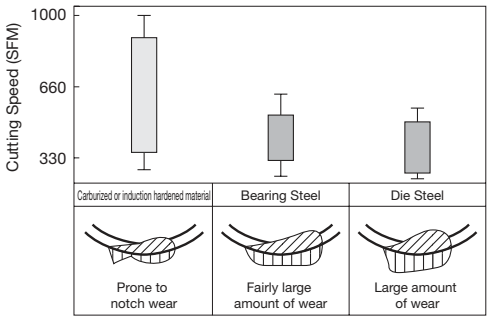
Failure		Cause	Basic Remedies	Countermeasure Examples
Drill Failure	Excessive Wear on Rake Face	· Inappropriate cutting conditions	· Use higher cutting speeds	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Increase feed rate	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Unsuitable coolant	· Reduce pressure if using internal coolant	· 1.5MPa or less (external coolant supply can be used at hole depths (L/D) of 2 or less)
			· Use coolant with more lubricity	· Use JIS A1 grade No.1 or its equivalent
	Chisel Point Breakage	· Off-center starts	· Reduce feed rate at entry point	· f=.0031 to .0047”
			· Pre-machining of flat surface for entry	· Drill flat base with Flat MultiDrill
		· Equipment, part materials, etc. lack rigidity	· Change cutting conditions to reduce resistance	· Increase v_c to decrease f (reduce thrust)
			· Improve clamp strength of work material	
		· Cutting edge is too weak	· Increase size of chisel width	· Use a chisel with a width of .004 to .008”
			· Increase amount of honing on cutting edge	· Increase the width of the thinning area at the centre by 1.5 times
	Breakage on Peripheral Cutting Edge	· Inappropriate cutting conditions	· Decrease the cutting speed	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Reduce feed rate	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Unsuitable coolant	· Use coolant with more lubricity	· Use JIS A1 grade No.1 or its equivalent
		· Equipment, part materials, etc. lack rigidity	· Improve clamp strength of work material	
		· Cutting edge is too weak	· Increase amount of honing on cutting edge	· Increase the width of the outer cutting edge by 1.5 times
			· Reduce the front relief angle	· Reduce the front relief angle by 2 to 3°
		· Entry from peripheral cutting edge	· Increase margin width (W margin specification)	· Increase the margin width by 2 to 3 times
		· Interrupted through cutting	· Reduce feed rate	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Increase amount of honing on cutting edge	· Increase the width of the outer cutting edge by 1.5 times
			· Reduce the front relief angle	· Reduce the front relief angle by 2 to 3°
	Margin Wear	· Inappropriate cutting conditions	· Decrease the cutting speed	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Unsuitable coolant	· Use coolant with more lubricity	· Use JIS A1 grade No.1 or its equivalent
			· Use more coolant	· If using external coolant, switch to internal coolant
		· Remaining margin wear	· Schedule for earlier regrind and ensure back taper	· If margin damage occurs, regrind to 1mm or less
		· Improper tool design	· Increase amount of back taper	· Make back taper 0.5/100
			· Reduce margin width	· Reduce the margin width to around 2/3
	Drill Breakage	· Chip blockage	· Use the optimal cutting conditions and tools	· Refer to recommended cutting conditions listed in the Cutting Tools Catalog
			· Use more coolant	· If using external coolant, switch to internal coolant
		· Holding clamp too weak	· Use strong holding clamp	· If the collet chuck is damaged, replace it · Change the collet holder to the next size up
		· Equipment, part materials, etc. lack rigidity	· Improve clamp strength of part material	
Unsatisfactory Hole Accuracy	Oversized Holes	· Off-centre starts	· Reduce feed rate at entry point	· f=.0031 to .0047”
			· Decrease the cutting speed	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Pre-machining added for entry in planar surfaces	· Planar machining with endmill
		· Drill bit lacks rigidity	· Use the optimal drill type for the hole depth	· Refer to the Cutting Tools Catalog
			· Improve overall drill rigidity	· Large web, small groove width
		· Drill bit has runout	· Improve drill mounting precision	· If the collet chuck is damaged, replace it
			· Improve drill retention rigidity	· Change the collet holder to the next size up
		· Equipment, part materials, etc. lack rigidity	· Improve clamp strength of part material	
	Poor Surface Roughness	· Inappropriate cutting conditions	· Increase the cutting speed	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Reduce feed rate	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Unsuitable coolant	· Use coolant with more lubricity	· Use JIS A1 grade No.1 or its equivalent
	Holes are not straight	· Off-centre starts	· Increase feed rate	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Drill is not mounted properly	· Improve drill mounting precision	· If the collet chuck is damaged, replace it
			· Improve drill retention rigidity	· Change the collet holder to the next size up
		· Equipment, part materials, etc. lack rigidity	· Improve clamp strength of part material	
			· Select a double margin tool	· Refer to the Cutting Tools Catalog
Unsatisfactory Chip Control	Chips clog	· Inappropriate cutting conditions	· Increase cutting speeds	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Increase feed rate	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Poor chip evacuation	· Increase volume if using internal coolant	
	Long Stringy Chips	· Inappropriate cutting conditions	· Increase feed rate	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Increase cutting speeds	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Strong cooling effect	· Reduce pressure if using internal coolant	· The pressure should be 0.5 MPa or less if using internal coolant
		· Dull cutting edge	· Reduce amount of edge honing	· Reduce the width to around 2/3

Hardened Steel Machining with CBN - SUMIBORON Edition

■ Recommended Zones for CBN by Workpiece Hardness and Shape

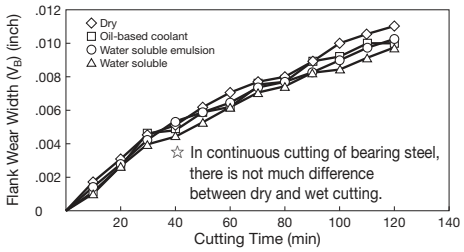


■ Cutting speed recommendations for each part material



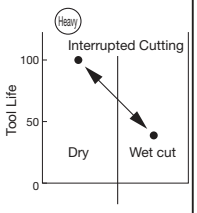
■ Influence of coolant on tool life

● Continuous Cutting



● Interrupted Cutting

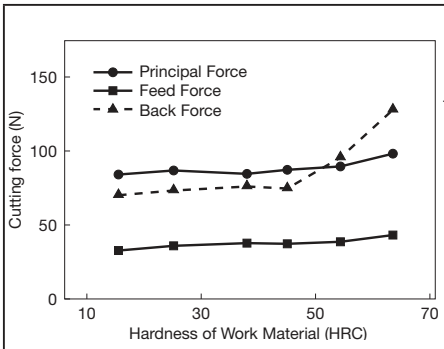
Milling of SKD11 to 4 U grooves
Cutting speed: v_c= 330 SFM
Depth of cut: a_p= .0079"
Feed rate (f)= .0039 IPR

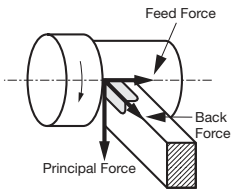


Part material: High Carbon Steel (58 to 62 HRC)
Cutting conditions: TPG321
v_c=330 SFM, a_p=.0059", f=.0039 IPR
Continuous Cutting

For continuous cutting, the influence of coolant on tool life is minimal.
For interrupted cutting, the thermal impact shortens the tool life in wet conditions.

■ Relation between part material hardness and cutting force

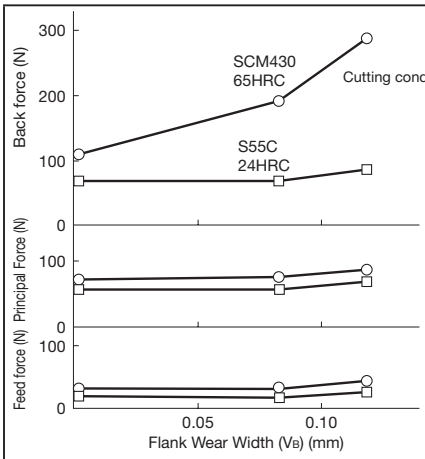




Part Material: Carbon Tool Steel
Cutting Conditions: Cutting speed (v_c) =400 SFM, depth of cut (a_p) =.0079", Feed rate (f) =.0039 IPR

Back force increases substantially for harder workpieces.

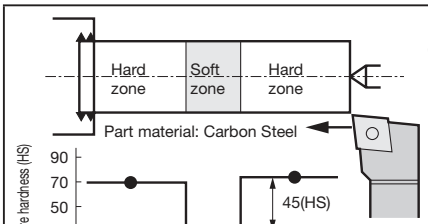
■ Relation between flank wear and cutting force



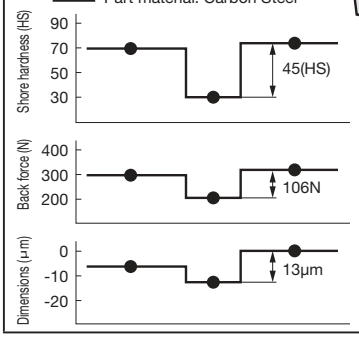
Cutting conditions: Cutting speed (v_c) = 80 m/min
Depth of cut (a_p) = 0.15mm
Feed rate (f) =0.1mm/rev

For hardened steel machining, back force increases substantially due to the expansion of flank wear.

■ Influence of part material hardness on cutting force and accuracy

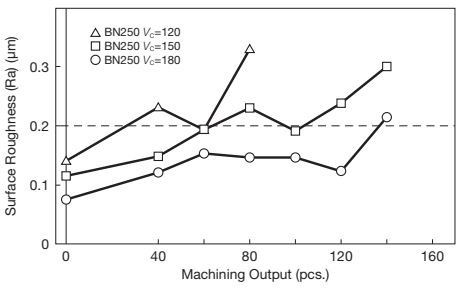


Cutting Speed : v_c = 400 SFM
Depth of Cut : a_p = .0197"
Feed Rate : f = .012 IPR, dry



External dimensions in the soft zone are smaller due to lower cutting forces.

■ Relation between cutting speed and surface roughness



Part material : Alloy Steel 58 to 62HRC
Holder : MTXNR2525
Tool : NU-TNMA160408

Cutting Conditions:
v_c =400,500,600 SFM
f = .0018 IPR
a_p = .0059"
Wet

At high cutting speeds, surface roughness is more stable.

■ Improvement of surface roughness by altering the feed rate

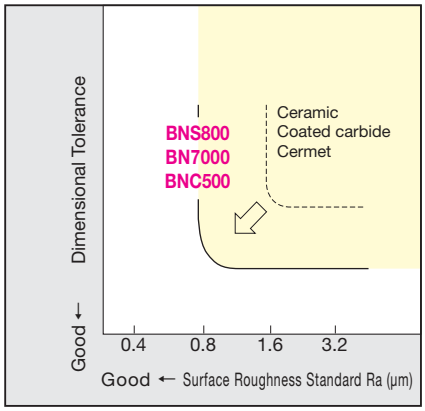
Constant Feed Rate	Variable Feed Rate
	Stationary Notch Location	Shifting Notch Location
	

☆ Varying the feed rate spreads the notch location over a larger area.
→Surface finish improves and notch wear decreases.

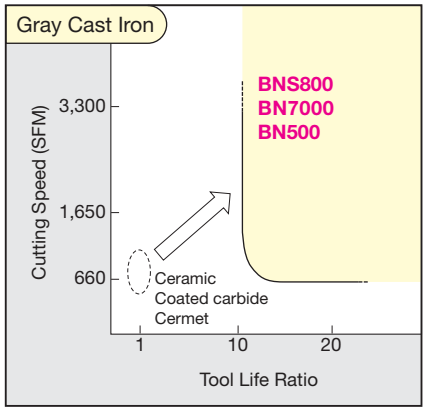
High Speed Machining of Cast Iron with CBN - SUMIBORON Edition

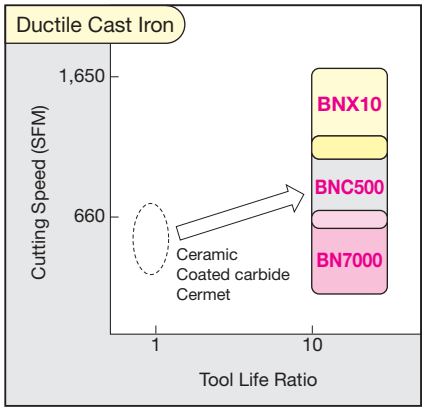
■ Advantages of using CBN - SUMIBORON for cast iron machining

● Higher accuracy



● Longer tool life at higher cutting speeds

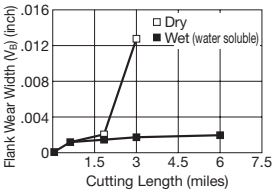




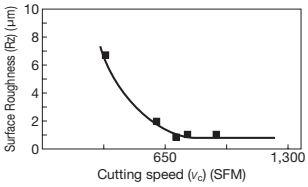
■ Turning

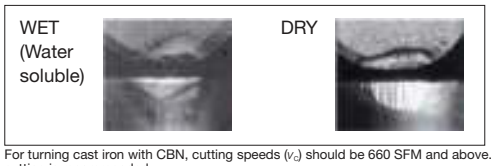
● Cast iron structure and wear shape examples

		Grey Cast Iron	Ductile Cast Iron
Structure			
	Matrix	Pearlite	Pearlite + Ferrite
Tool wear shape	Wet		
	Dry	 Crater wear	
(v_c=660 to 1,650 SFM)



Part material : Continuous cutting with Ductile Cast Iron
Tool material : BN500
Tool Shape : SNG432
Cutting Conditions : v_c = 1,500 SFM
a_p=.0098"
f =.0059 IPR
Dry & Wet (water soluble)





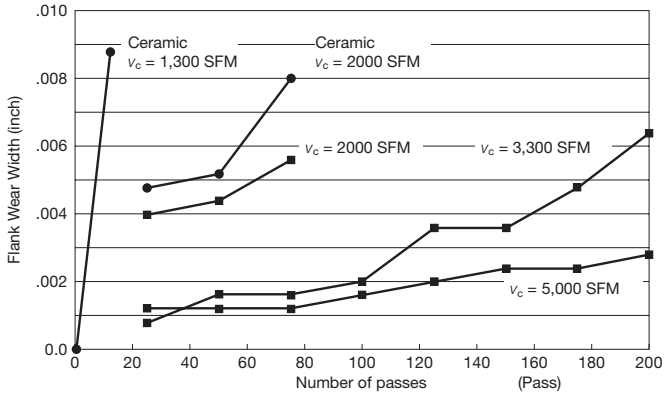
For turning cast iron with CBN, cutting speeds (v_c) should be 660 SFM and above. Wet cutting is recommended.

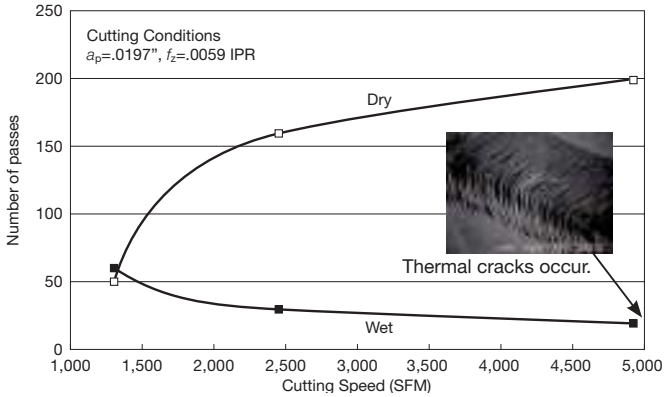
Machine : N/C lathe
Part Material : Ductile Cast Iron 200HB
Holder : MTJNP2525
Tool Grade : BN500
Tool Shape : TNMA332
Cutting Conditions : v_c=360 to 925 SFM
f =.0039 IPR
a_p=.0039"
Wet

■ Milling

BN Finish Mill EASY (for high-speed finishing of cast iron)

- Enables cutting with v_c of 6,600 SFM
- Surface finish roughness 3.2Rz (1.0Ra)
- Economical insert reduces running costs.
- Unit style enables easy runout adjustment.
- Employs safe, anti-centrifugal-force construction for high-speed conditions.





- Part material: Gray cast iron (FC250)
- Cutting conditions: a_p =.0197", f_z =.0039 IPR dry
- Tool grade: BN7000

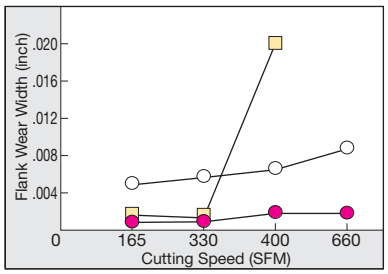
Dry cutting is recommended for high speed milling of cast iron with CBN.

Machining Exotic Alloys with CBN - SUMIBORON Edition

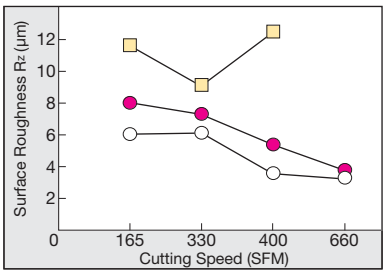
■ Powdered Metal

SUMIBORON — Cemented Carbide — Cermet

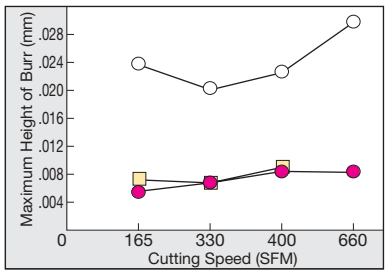
1. Flank wear



2. Surface roughness



3. Height of burr



Part material: Powdered Metal (HRB40), ø3.15-ø3.94" heavy interrupted facing with grooves and drilled holes. (After 40 passes)
Cutting conditions: f=.0039 IR, a_p=.0039" Wet
Tool Cat. No.: TNGA331

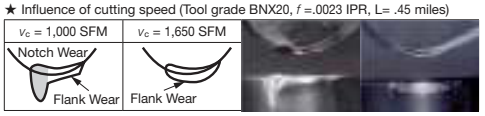
Enables cutting at v_c of up to 330 SFM even with cemented carbide. However, if v_c is around 400 SFM or higher, wear occurs rapidly, resulting in poorer surface roughness and greater spread of burrs. On the other hand, CBN exhibits stability and superior wear resistance, burr prevention and surface roughness, especially at high speeds.

■ Heat-Resistant Alloy

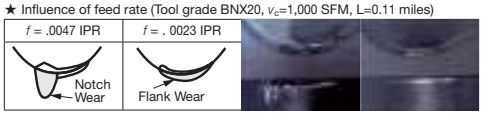
• Nickel based alloy

Typical tool damage of CBN tool when cutting Inconel 718

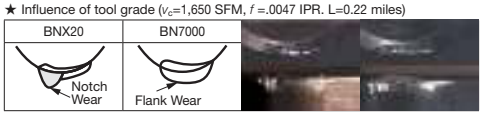
★ Influence of cutting speed (Tool grade BNX20, f =.0023 IPR, L= .45 miles)



★ Influence of feed rate (Tool grade BNX20, v_c=1,000 SFM, L=0.11 miles)



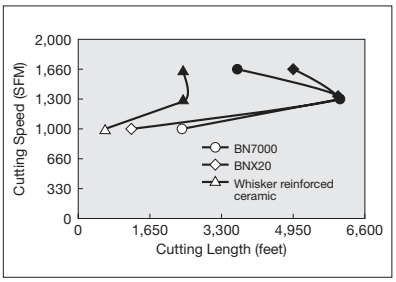
★ Influence of tool grade (v_c=1,650 SFM, f =.0047 IPR. L=0.22 miles)



Cutting Conditions: a_p= .0118", Wet

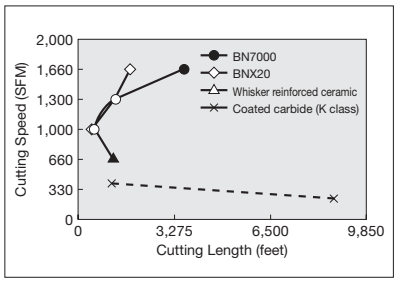
0. 5mm

Cutting conditions: f = .0023 IPR, a_p= .0118", wet



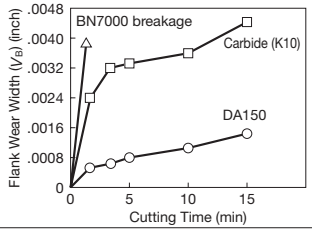
Tool life criteria
Notch wear = .010" (○)
or flank wear = .010"
BNX20 is recommended for high speed and low feed rates; BN7000 is recommended for cutting speeds below v_c = 800 SFM.

Cutting conditions: f = .0047 IPR, a_p= .0118", wet

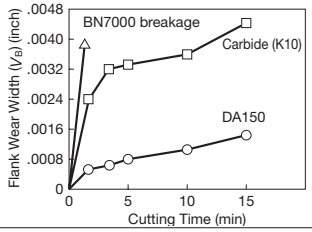


Tool life criteria
Notch wear = .010" (★)
or flank wear = .010"
BN7000 is recommended for cutting at high feed rates (over f = .0039 IPR).

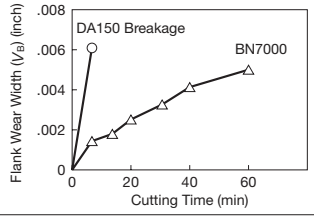
• Ti based alloy



Part material: Ti-6A-4V
Tool: NF-DNMX331
Cutting Conditions: v_c=330 SFM, a_p=.0039", f=.0019 IPR Wet
☆ Our ultra-sharp positive PCD inserts have a strong cutting edge and excellent wear resistance



Part material: Ti-6A-4V
Tool: NF-DNMX331
Cutting Conditions: v_c=330 SFM, a_p=.0039", f=.0019 IPR Wet
☆ Our ultra-sharp positive PCD inserts have a strong cutting edge and excellent wear resistance

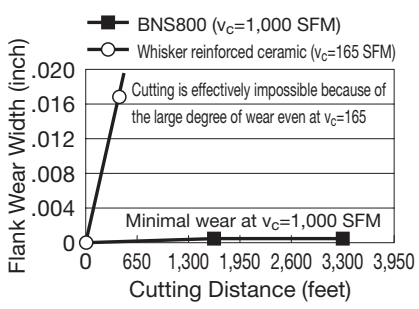


Part material: Ti-6Al-4V
Tool: DNMA434
Cutting Conditions: v_c=400 SFM, a_p=.0118", f=.0098 IPR Wet
☆ Highly fracture-resistant BN7000 negative insert is suitable for high-efficiency machining with large depth of cut and high feed rate.

■ Hard Facing Alloys

Part Material: Colmonoy No.6
(NiCr-based self-fluxing alloy)

Tool Cat. No. : SNG322
Cutting conditions : v_c=165 SFM , 1000 SFM
f = .0039 IPR
a_p= .008"
Dry

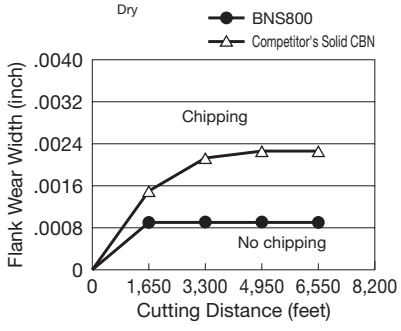


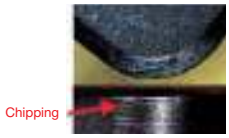
Whisker reinforced ceramic
(v_c = 165 SFM, after 330 feet of cutting)

BNS800
(v_c = 1,000 SFM, after 3,300 feet of cutting)

Part Material: Stellite SF-20
(Co-based self-fluxing alloy)

Tool Cat. No. : SNG322
Cutting conditions : v_c= 165 SFM
f = .0039 IPR
a_p= .008"
Dry





Competitor's Solid CBN
(After 6,500 feet of cutting)

BNS800
(After 6,500 feet of cutting)

Cutting Edge Failure & Countermeasures for Machining Hardened Steel - CBN

Insert Failure	Cause	Countermeasures
Flank Wear 	· Grade lacks wear resistance	· Select a more wear-resistant grade (eg BNC2010, BN1000 or BN2000)
	· Cutting speed is too fast	· Reduce the cutting speed to V_c=660 SFM or less (higher feed rate also reduces tool-to-work contact time)
		· Use an insert with a larger relief angle
Crater Wear 	· Grade lacks crater wear resistance	· Select a higher efficiency grade (eg BNC2010, BNX25 or BNX20)
Breakage at Bottom of Crater 	· Cutting speed is too fast	· Reduce the cutting speed to V_c=660 SFM or less and increase the feed rate (low speed, high feed) (higher feed rate alone also reduces tool-to-work contact time)
Flaking 	· Grade lacks toughness	· Select a tougher grade (eg BNC2020 or BN2000)
	· Back force is too high	· Select an insert with a stronger cutting edge (Increase negative land angle and perform honing)
		· If the grade is tough enough, improve the cutting edge sharpness
Notch Wear 	· High stress at boundary	· Change to a grade with a higher notch wear resistance (e.g. BNC2010 or BN2000)
		· Increase cutting speed (500 SFM or more)
		· Change to the Variable Feed Rate method, which alters the feed rate in fixed output intervals
		· Increase negative land angle and perform honing
Chipping at Forward Notch Position 	· Impact to front cutting edge is too large or occurs constantly	· Change to a micro-grained grade with a higher fracture resistance (e.g. BNC300 and BN350)
		· Increase the feed rate (higher feed rates are recommended to reduce chipping)
		· Select an insert with a stronger cutting edge (Increase negative land angle and perform honing)
Chipping at Side Notch Position 	· Impact to side cutting edge is too large or occurs constantly	· Change to a grade with a higher fracture resistance (e.g. BN350 or BNC300)
		· Reduce feed rate
		· Use an insert with a larger side cutting angle
		· Use an insert with a larger nose radius
		· Select an insert with a stronger cutting edge (Increase negative land angle and perform honing)
Thermal Crack 	· Thermal shock is too severe	· Completely dry conditions are recommended
		· Select a grade with better thermal conductivity
		· Reduce cutting speed, feed rate, and depth of cut to decrease the machining load.

■ Steel and Non-Ferrous Metal Symbols Chart (Excerpt)

● Classifications and Symbols of Steels

Classification	Material	Symbol	Code Description
Steel for Structure	Rolled Steels for welded structures	SM	"M" for "Marine": Usually used in welded marine structures
	Re-rolled Steels	SRB	"R" for "Re-rolled" and "B" for "Bar"
	Rolled steel for general structures	SS	S for "Steel" and S for "Structure"
	Light gauge sections for general structures	SSC	"C" for "Cold" after SS
Steel Sheets	Hot rolled mild steel sheets / plates in coil form	SPH	P for "Plate" and "H" for "Hot"
Steel Tubes	Carbon steel tubes for piping	SGP	"GP" for "Gas Pipe"
	Carbon steel tubes for boiler and heat exchangers	STB	"T" for "Tube" and "B" for "Boiler·
	Seamless steel tubes for high-pressure gas cylinders	STH	"H" for "High Pressure" after ST
	Carbon steel tubes for general structures	STK	"K" for "Kozo" ("structure" in Japanese) after ST
	Carbon steel tubes for mechanical structures	STKM	"M" for "Machine" after STK
	Alloy steel tubes for structures	STKS	"S" for "Special" after STK
	Alloy steel tubes for piping	STPA	"A" for "Alloy" after STP
	Carbon steel tubes for pressure piping	STPG	"P" for "Piping" and "G" for "General" after ST
	Carbon steel tubes for high-temperature piping	STPT	"T" for "Temperature" after ST
	Carbon steel tubes for high-pressure piping	STS	"S" for "Special" after ST
	Stainless steel tubes for piping	SUS-TP	"T" for "Tube" and "P" for "Piping" after SUS
Steel for Mechanical Structures	Carbon steels for mechanical structures	SxxC	"C" for "Carbon"
	Aluminium-chromium-molybdenum steels	SACM	"A" for "Al", "C" for "Cr" and "M" for "Mo"
	Chromium molybdenum steels	SCM	"C" for "Cr" and "M" for "Mo"
	Chromium steels	SCr	"Cr" for "Chromium" after "S" for "Steel"
	Nickel Chromium steels	SNC	"N" for "Nickel" and "C"for "Chromium"
	Nickel Chromium Molybdenum steels	SNCM	"M" for "Molybdenum" in SNC
	Manganese steels for mechanical structures Chromium steels	SMn SMnC	"Mn" for "Manganese" "C" for "Chromium" in SMn
Special Steels – Tool Steels	Carbon tool steels	SK	"K" for "Kogu" ("tool" in Japanese)
	Hollow drill steels	SKC	"C" for "Chisel" after SK
	Alloy tool steel	SKS SKD SKT	S for "Special" after SK D for "Die" after SK T for "Tanzo" - "forging" in Japanese after SK
	High-speed tool steels	SKH	"H" for "High speed" after SK
Special Steels – Stainless Steel	Free cutting sulphuric steels	SUM	"M" for "Machinability" after SU
	High-carbon chromium bearing steels	SUJ	"J" for "Jikuuke" ("bearing" in Japanese) after SU
	Spring steels	SUP	"P" for "Spring" after SU
	Stainless Steel	SUS	"S" for "Stainless Steel" after SU
Special Steels – Heat-resistant Steel	Heat-resistant Steel	SUH	"U" for "Special Usage" and "H" for "Heat"
	Heat-resistant steel bars	SUH-B	"B" for "Bar" after SUH
	Heat-resistant steel sheets	SUHP	"P" for "Plate" after SUH
Forged Steels	Carbon steel forgings for general use	SF	"F" for "Forging"
	Carbon steel booms and billets for forgings	SFB	"B" for "Billet" after SF
	Chromium molybdenum steel forgings	SFCM	"C" for "Chromium" and "M" for "Molybdenum" after SF
	Nickel Chromium Molybdenum steel forgings	SFNCM	"N" for "Nickel" in SFCM
Cast Iron	Gray cast iron	FC	"F" for "Ferrous" and "C" for "Casting"
	Spherical graphite / Ductile cast irons	FCD	"D" for "Ductile" after FC
	Blackheart malleable cast irons	FCMB	"M" for "Malleable" and "B" for "Black" after FC
	Whiteheart malleable cast irons	FCMW	"W" for "White" after FCM
	Pearlite malleable cast iron	FCMP	"P" for "Pearlite" after FCM
Cast Steels	Carbon cast steels	SC	"C" for "Casting"
	Cast stainless steels	SCS	"S" for "Stainless Steel" after SC
	Heat-resistant cast steels	SCH	"H" for "Heat" after SC
	High-manganese cast steels	SCMnH	"Mn" for "Manganese" and "H" for "High" after SC

● Non-Ferrous Metals

Classification	Material	Symbol
Copper and Copper Alloys	Copper and copper alloys - sheets, plates and strips	CxxxxP
		CxxxxPP
		CxxxxR
	Copper and copper alloys - welded pipes and tubes	CxxxxBD
		CxxxxBDS
		CxxxxBE
		CxxxxBF
Aluminum and Aluminum Alloys	Aluminum and Al alloys - Sheets, plates and strips	AxxxxP
		AxxxxPC
	Aluminum and Al alloys Rods, bars, and wires	AxxxxBE
		AxxxxBD
		AxxxxW
	Aluminum and Al alloys - Extruded shapes	AxxxxS
	Aluminum and Al alloy castings	AxxxxFD
		AxxxxFH
Wrought Alloys – Magnesium	Magnesium alloy sheets and plates	MP
Material – Nickel	Nickel-copper alloy sheets and plates	NCuP
	Nickel-copper alloy rods and bars	NCuB
Wrought Materials – Titanium	Titanium rods and bars	TB
Castings	Brass castings	YBsCx
	High-strength brass castings	HBsCx
	Bronze castings	BCx
	Phosphorus Bronze castings	PBCx
	Aluminum bronze castings	AlBCx
	Aluminum alloy castings	AC
	Magnesium alloy castings	MC
	Zinc alloy die castings	ZDCx
	Aluminum alloy die castings	ADC
	Magnesium alloy die castings	MDC
	White metals	WJ
	Aluminum alloy castings for bearings	AJ
	Copper-lead alloy castings for bearings	KJ

Note (1) The fractional values are the taper standards.
(2) Diameters D_1 and d_1 are calculated from the diameter D value, the taper, a, and ℓ_1 and rounded up to one decimal place.
Remark 1. Tapers are measured using JIS B 3301 ring gauges. At least 75% must be correct.
2. Screws must have metric coarse screw thread as per JIS B 0205 and Class 3 precision as per JIS B 0209.

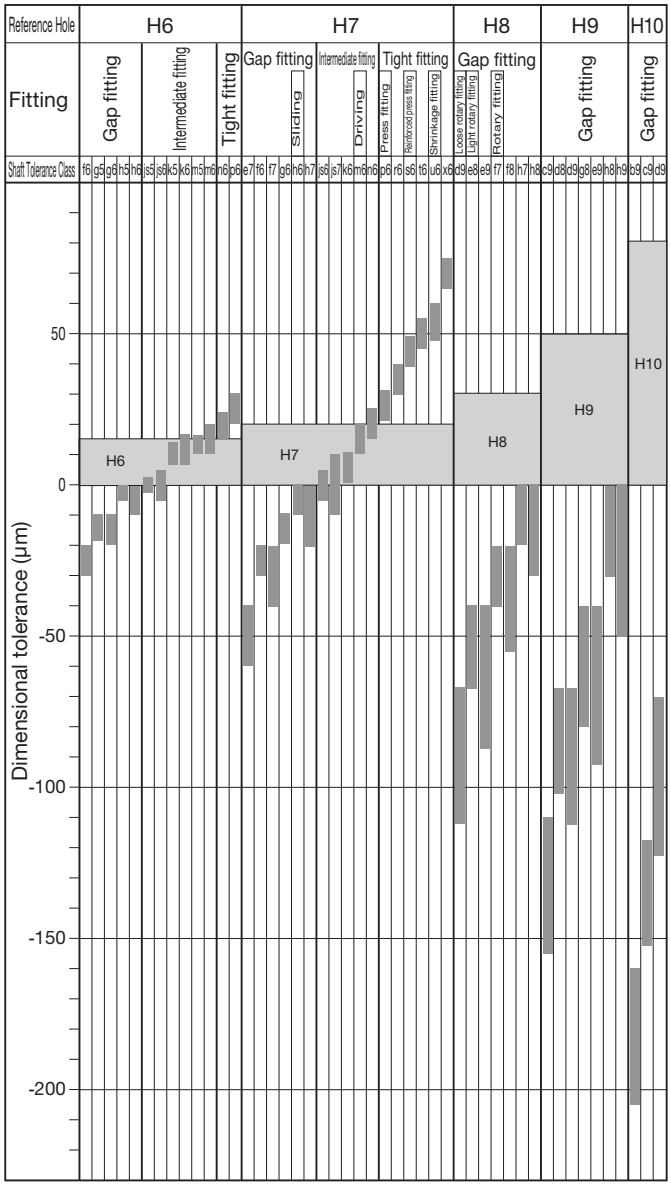
		C9	D9	E9			H9										
	B10	C10	D10														

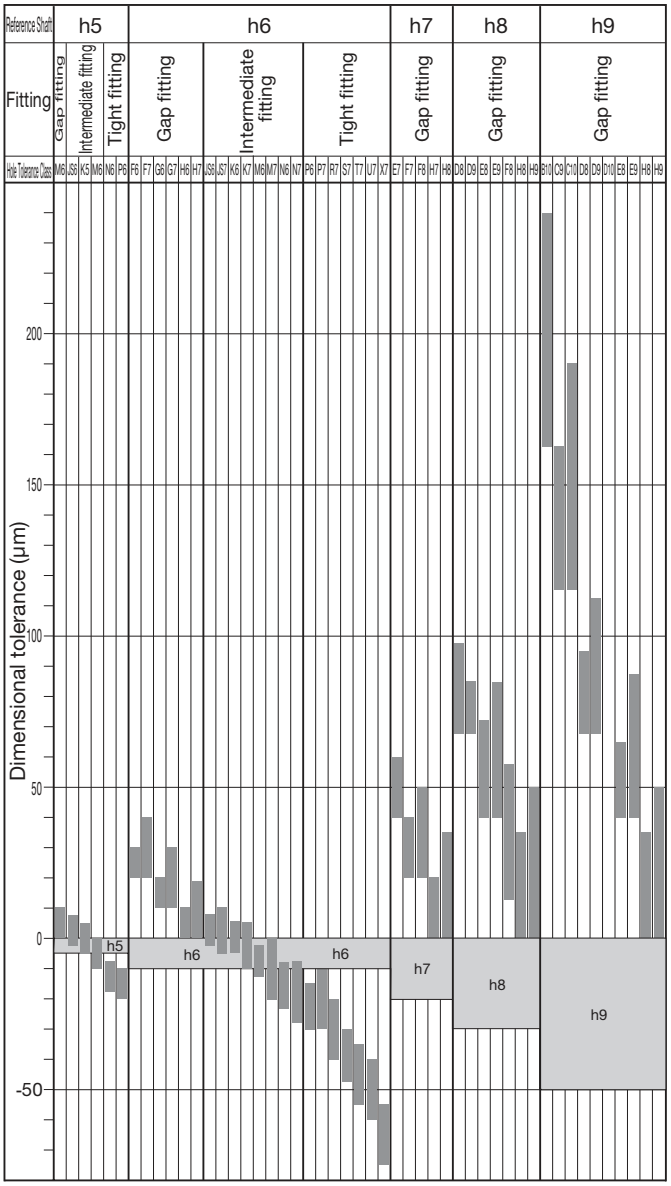
Note: *Exceptions may arise with these fittings depending on the dimension category.

● Correlation of Tolerance Zones in Standard Hole Fittings



Note: The above table is for reference dimensions greater than 18mm up to 30mm.

● Correlation of Tolerance Zones in Standard Shaft Fittings



Note: The above table is for reference dimensions greater than 18mm up to 30mm.

■ Surface Roughness

● Types and Definitions of Typical Surface Roughness

Type	Symbol	Method of Determination	Descriptive Figure
R Max.	*1) Rz	This value is found by extracting the reference length in the mean line direction from the surface roughness curve, measuring the intervals between the peaks and valleys in the extracted area in the longitudinal magnification direction of the surface roughness curve, and expressing this value in micrometres (μm). Remarks: When finding Rz, any areas deemed to be scratches are removed before extracting the reference length from an area with no high peaks or low valleys.	 Rz=Rp+Rv
Calculated Roughness	Ra	This value is found by extracting the reference length in the mean line direction from the roughness curve, taking the average line direction of the extracted area as the X-axis and the longitudinal magnification direction as the Y-axis and expressing the value found by the equation below in micrometres (μm) with the roughness curve expressed by y=f(x).	 $Ra=\frac{1}{\ell}\int_0^{\ell}\{f(x)\}dx$
10-point Average Roughness	*2) Rz JIS	This value is found by extracting the reference length in the mean line direction from the roughness curve, finding the sum of the mean absolute peak height taken from the five highest peaks (Yp) and the mean absolute valley height taken from the five lowest valleys (Yv) measured in the longitudinal magnification direction from the average line direction of the extracted area and expressing this value in micrometres (μm).	 $Rz_{JIS}=\frac{(Yp1+Yp2+Yp3+Yp4+Yp5)+(Yv1+Yv2+Yv3+Yv4+Yv5)}{5}$

Designated values for the above types of maximum height (Rz)*1), 10-point average roughness (Rz JIS)*2), calculated average roughness (Ra) classifications, and reference length ℓ are shown on the table at right with triangular symbols.

*1) The maximum height symbol (Rz) is calculated according to the new JIS B 0601:2001 standard. (This value was Ry under the old standard.)

*2) The 10-point average roughness (Rz JIS) is calculated according to the new JIS B 0601:2001 standard. (This value was Rz under the old standard.)

● Relationship with triangular symbol display

Designated values for maximum height *1) (Rz)	Designated values for calculated average roughness (Ra)	Designated values for 10-point average roughness *2) (RzJIS)	Standard reference ℓ length value (*mm*)	Triangular* Symbols
(0.05) 0.1 0.2 0.4	(0.012) 0.025 0.05 0.10	(0.05) 0.1 0.2 0.4	*0.25*	▽▽▽▽
0.8	0.20	0.8		
1.6 3.2 6.3	0.40 0.80 1.6	1.6 3.2 6.3	*0.8*	▽▽▽
12.5 (18) 25	3.2 6.3	12.5 (18) 25	*2.5*	▽▽
(35) 50 (70) 100	12.5 25	(35) 50 (70) 100	*8*	▽
(140) 200 (280) 400 (560)	(50) (100)	(140) 200 (280) 400 (560)	—	—

Remarks: The designated values in ( ) do not apply unless otherwise stated.

* Finish symbols (triangular symbol (▽) and tilde (~)) were removed from JIS in the 1994 revision.

A.L.M.T. Corp.

Nano/Microforming Tools

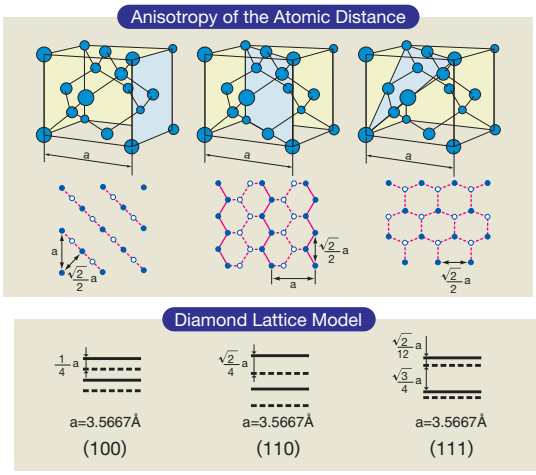
Ultra-Precision Cutting Tool UPC™

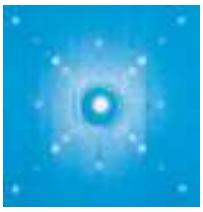
As a leading manufacturer of ultra-precision diamond cutting tools, A.L.M.T. Corp. offers a broad range of nano- and micro-forming cutting tools to meet market needs.
Our many years of experience and extensive knowledge give us a comprehensive understanding of the optimal physical properties of single-crystal diamond.
Our state-of-the-art development process yields the highest precision in ground tool edge measurement. As a result, our diamond cutting tools achieve high-precision microscopic cutting of work materials in the order of nanometres.

Selection and Measurement Technology

Identify the anisotropy of atoms in single-crystal diamond and pursue the best crystal orientation

Creation of tools to achieve cutting edge sharpness in the order of nanometres starts with the screening and selection of single-crystal diamond.
The lattice constant of diamond is always 3.5667 Å, but the distance between crystal faces varies, causing differences in the ease of cleavage and intrusion of impurities. Therefore, sorting of rough diamonds is important in addition to the identification of crystal orientation according to the machining conditions.





X-Ray Photograph of Single-crystal Diamond

Grinding and Measurement Technologies

Cutting edge grinding technology that produces nanometre-controlled movement

In order to accurately produce nanometre-controlled movement on work materials, a cutting tool requires a sharp cutting edge capable of producing nanometre-sized chips and high profile precision. We have achieved this using our unique grinding and measurement technologies.

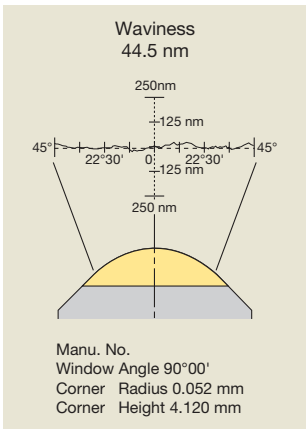


Chart of inspection using our uniquely developed waviness meter

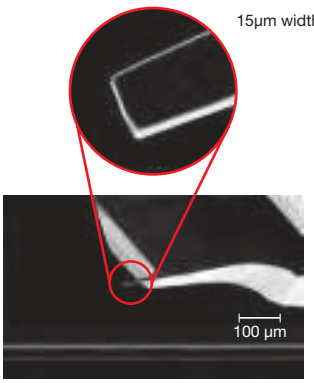
Nanometre-sized chips

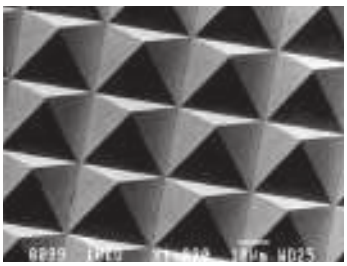
Nano/Micro Processing Technology

Straightness and surface roughness unattainable with photolithography or ion-beam method

With its cutting edge sharpness in the order of nanometres, A.L.M.T.'s UPC-Nano series achieves a surface roughness and straightness that cannot be obtained by the photolithography or ion-beam method.
This technology is also effective for micrometre-order processing of high aspect ratio.



Size comparison at same magnification
(Nano Endmill (width 15 µm) and human hair (ø50 µm))



Mould surface processed in the order of micrometres

Ultra-fine Grooving Type

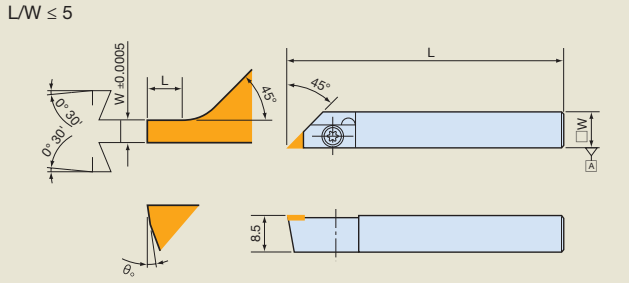
UPC™-Nano Groove™

Features

1. 3 µm width of cut grooving tools
2. Provides the world's highest-level dimensional accuracy of ±0.5 µm
3. Durable cutting edge with high-precision grinding
4. Enables high-precision fine grooving that cannot be achieved using the photolithography or ion-beam method

Applications

1. Hologram diffraction grating moulds
2. Fine linear groove milling
3. Moulds with fine groove milling
4. Optical sheet moulds



Standard Size	(1) L : 51, W : □6.35 (2) L : 60, W : □8

Endmill (Square Type)

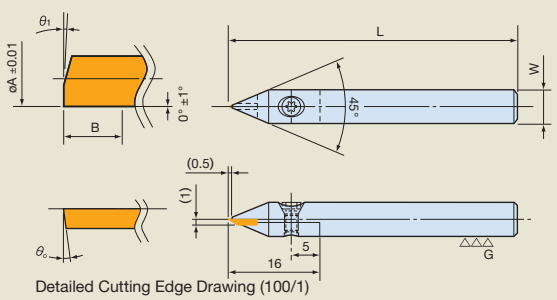
UPC-Nano Endmill™

Features

1. Enables 30 µm groove width and world's smallest curves for flexible grooving
2. Enables machining with a high aspect ratio 2.5 times the rotation diameter
3. Durable cutting edge with high-precision grinding
4. Enables high-precision fine grooving that cannot be achieved using the photolithography or ion-beam method

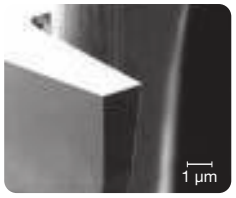
Applications

1. Hologram grating
2. Fine free curve groove milling
3. LCD prism sheet moulds
4. Micro machine parts grooving

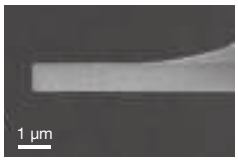


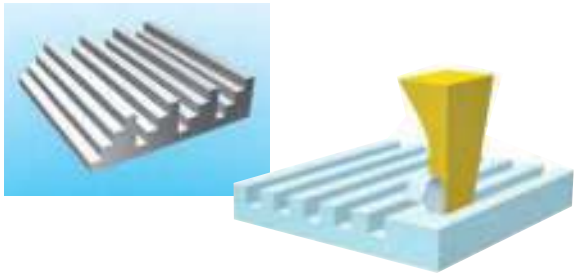
Detailed Cutting Edge Drawing (100/1)

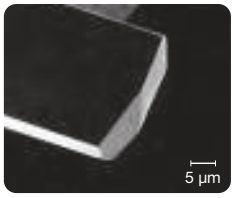
Standard Size	(1) L : 50, W : ø6 (2) L : 30, W : ø4



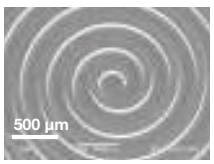
Nano Groove Cutting Edge

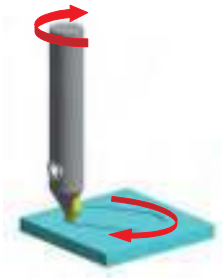






Example of Grooving Using a Nano Endmill





Endmill (Ballnose Type)

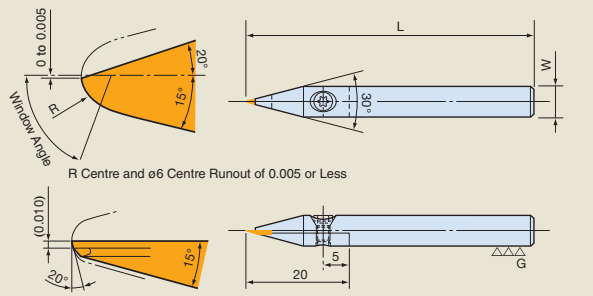
UPC-Nano Ballnose Endmill™

Features

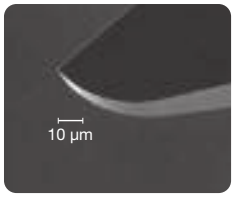
1. Ballnose endmill is world's smallest in its class with radius of 30 µm
2. Provides the world's highest-level precision at 50 nm waviness
3. Enables high-precision 3D machining with its extremely sharp cutting edge

Applications

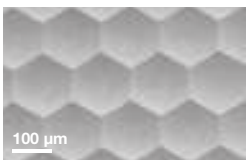
1. Micro lens array
2. Free-form submillimeter lens
3. LCD prism sheet moulds
4. Micro machine parts grooving

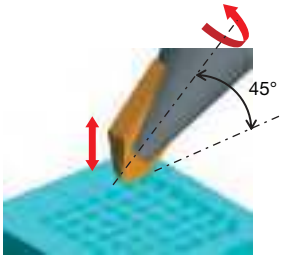


Standard Size	(1) L : 50, W : ø6 (2) L : 30, W : ø4



Example of Grooving Using a Nano Ballnose Endmill





Formed Type

UPC™-Nano Profile™

Features

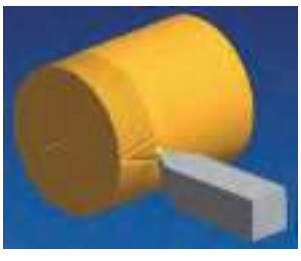
1. Enables flexible one-pass machining of free-form surfaces including elliptical and paraboloidal surfaces with shape accuracy of 1 µm or less
2. Ensures high-form accuracy in machining of paraboloidal and other free-form surfaces

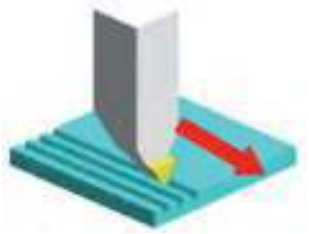
Applications

1. Optical sheet moulds for LCD panels
2. Micro lens array moulds
3. Various optical element moulds

Elliptical Cutting Edge

Parabolic Cutting Edge





UPC™-R

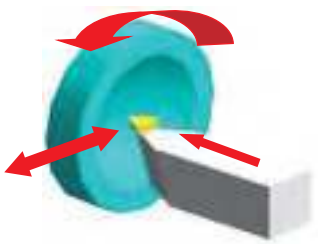
UPC™-R exhibits outstanding performance in ultra-precision spherical and aspherical cutting

Features

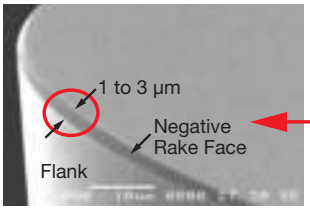
1. Achieves cutting edge arc waviness of 50 nm (0.05 μm) over a wide working angle range of 90°.
2. The cutting edge is uniformly finished in high quality, achieving a surface roughness in the order of nanometres.
3. A record of the cutting edge arc waviness measured with our uniquely developed measuring instrument (with a resolution of 5 nm) is attached to the product for thorough quality control.

Applications

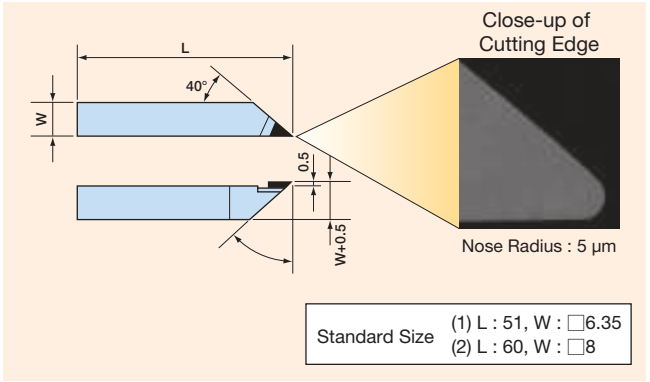
1. Camera lens moulds for CD, DVD, and BD players
2. Lens moulds for digital cameras
3. Camera lens moulds for smartphones, PCs, and tablets
4. Infrared lens
5. Spherical and aspherical mirrors for lasers and X-rays
6. Various spherical and aspherical lenses
7. Profile processing using an ultra-precision processing machine



UPC™ Cutting Edge for Infrared (IR) Lenses and Cemented Carbide Moulds



Uniform Negative Rake Face of Cutting Edge (Patented)



Standard Size	(1) L : 51, W : □6.35 (2) L : 60, W : □8

	High Precision S	0.25 μm	0.5 μm	1 μm					

UPC™-F

Exhibits full potential for high-efficiency, ultra-precision cutting in planar and cylindrical shapes

Features

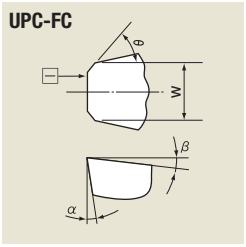
1. Drastically reduces or eliminates running-in machining time.
2. Obtain uniform, high-quality machined surfaces by setting the roundness (sharpness) of the cutting edge according to the work material and cutting conditions.

Applications

1. Laser reflective mirrors
2. Polygon mirrors
3. Photosensitive drums of copying machines
4. Planar and cylindrical mirror finishing

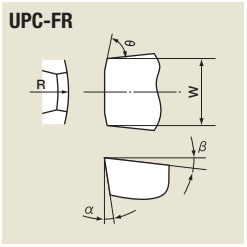
Cutting Edge Shape

UPC-FC



Exclusive Blade Type for Polygon Mirrors

UPC-FR



Dimensions and Highest Accuracy

UPC-FR	10° to 45°	2.0 to 4.0 mm	2° to 5°	0°	0°	30 to 40 mm

UPC™-T

Ideal for fine grooving such as that for Fresnel lenses

Features

1. The cutting edge is uniform and extremely sharp, free from chipping and undulation.
2. Guarantees the cutting edge shape in the order of submicrons.

Applications

1. LCD prism sheet moulds
2. Fresnel lens moulds
3. Optical sheet moulds
4. Various diffraction grating moulds
5. Other fine grooving

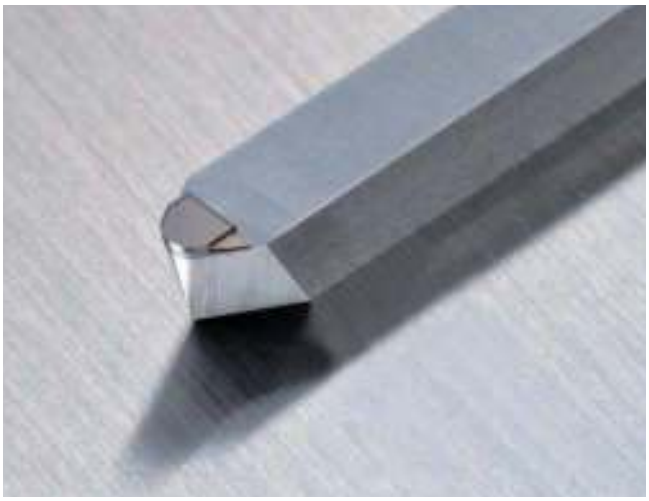
BL-UPC

SUMIDIA™ Binderless (Nano-polycrystalline Diamond)

Ultra-Precision Cutting Tool BL-UPC



Employs SUMIDIA™ Binderless on the cutting edge of UPC™

Achieves long tool life in mirror finish and fine machining of cemented carbides

Features of SUMIDIA™ Binderless

- Fine grains of a few dozen nanometres are firmly and directly bonded together without the use of a binder.
- Harder than single-crystal diamond.
- No anisotropy or specific cleavage.

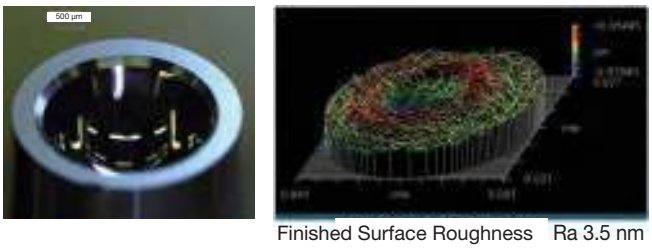
BL-UPC Features

- Superior fracture and wear resistance compared to single-/polycrystalline diamond.
- Sharp and precise cutting edge equivalent to UPC™ (single-crystal diamond).
- Free from uneven wear caused by crystal orientation, as it is not anisotropic.

Applications

- Moulds for cemented carbide glass lenses
- Large moulds for prism sheets and light guide plates
- Glass lenses
- Machining of other high-hardness and brittle materials

Surface Roughness of Machined Cemented Carbide



Finished Surface Roughness Ra 3.5 nm

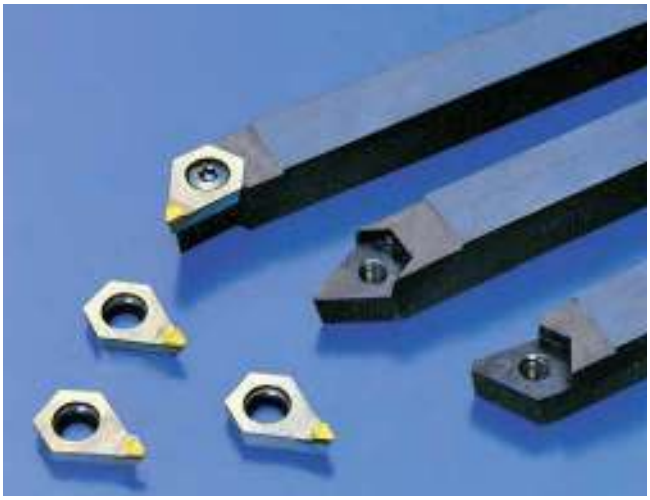
New D Tools

New D Tools™



***New D Tools*™ NewD**

Achieves stability and long tool life by measuring and optimising the crystal orientation

Features

(1) Reduces variation in tool life, a weakness of single-crystal diamond tools, and achieves 1.5 to 2 times longer tool life than conventional tools on average.
(2) The combination of our uniquely designed inserts and holders enables easy and precise tool setting, as with indexable inserts.
(3) There are inserts for straight cutting and for curved-surface copying. The shape accuracy of the latter is 5μm.
(4) The rake face is free from adhesion and accumulation of chips, maintaining high-quality machined surfaces even during continuous use.
(5) The diamond is firmly attached by a unique brazing method.
(6) Exhibits high durability even during interrupted cutting.
(7) Unlike the conventional type with a retaining cap, there is no retaining cap to hold the diamond. This enables chips to move smoothly on the rake face, improving the machining accuracy.

Applications

- Automotive components (pistons, aluminum wheels, compressors, commutators, etc.)
- Plastic lenses, resin mould parts
- HDD parts
- Aluminum die cast alloys ad other non-ferrous metal components

PCD Rotating Tools

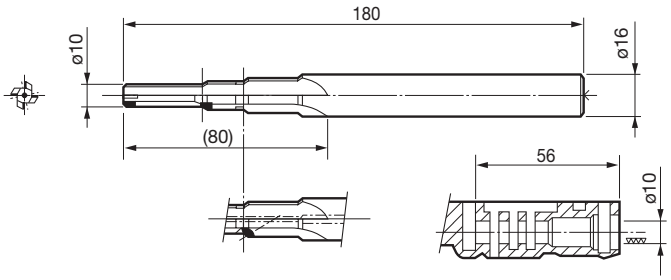
Features

- Multiple parts can be machined in a single pass by using an integrated stepped tool.
- Adoption of diamond offers significantly improved tool life (over 10 times longer than that of carbide tools).
- Surfaces can be machined without burn at a cutting speed of 300 m/min or higher.
- Stable performance can be achieved by using emulsion type water-soluble coolant.
  (Semi-dry cutting is also possible depending on your environment.)

Applications

- Non-Ferrous Metal (Aluminum Alloy, Copper Alloy, etc.)

PCD Reamer Application Example (Automobile hydraulic regulator valve reaming)



Work Shape

Functions	PCD Reamer	Cemented Carbide Reamer
Cutting Speed (m/min)	120	120
Feed Rate (mm/rev)	0.2	0.2

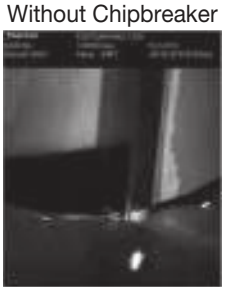
Coolant	Water soluble	Oil-based
Machined Surface Roughness (μmRz)	3	8
Circularity (μm)	5	10
Economic Efficiency Ratio	0.5	1

Data 1 : Improved Productivity by Breaking Chips

Negative Land Specification Cutting Edge

Chip breaking function is enhanced to prevent a reduction in productivity due to problems caused by chips. Solutions are proposed according to the type of chip problem.

Without Chipbreaker



Forms long chips that don't curl.
· Wrapping around tool
· Remnants on workpiece

With Chipbreaker

Chips are forcibly curled and cut into fine pieces.
· No wrapping around tool
· No chip remnants

Data 2 : Good Balance between High-Efficiency Cutting and High Machining Accuracy

Precision diamond tooling technology enables high quality coaxial manufacturing with excellent tool runout precision. High-precision and high-efficiency machining can be achieved.

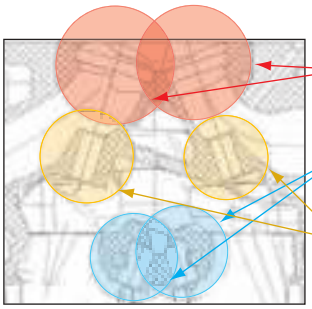
PCD Rotating Tools

Machining Process

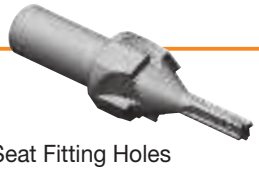


Process 1
Finishing of Valve Seat Fitting Holes

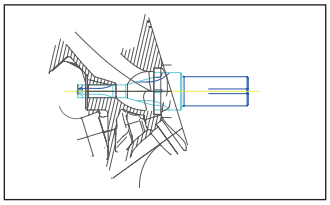
Process 2
Finishing of Hydraulic Lash Adjuster (HLA) Holes

Process 3
Finishing of Intake and Exhaust Valve Guide Holes

Process 1 Finishing of Valve Seat Fitting Holes



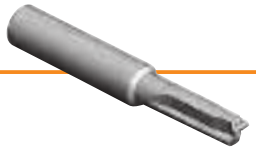
Resolves coaxiality and cylindricity issues with the high shank rigidity and high quality cutting edge.



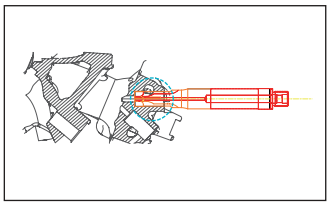
■ Specifications for Finishing of Valve Seat Fitting Holes

	Machine : Horizontal Machining Centre	
Cutting Conditions	Spindle Speed (min^{-1})	6,000
	Feed Rate (mm/rev)	0.48
	Feed Rate (mm/min)	2,880
	Stock Removal (mm/diameter)	0.6
	Coolant	Emulsion-type water-soluble oil

Process 2 Finishing of Hydraulic Lash Adjuster (HLA) Holes



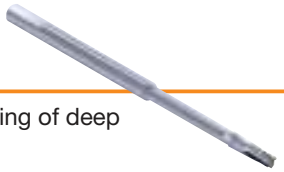
Achieves high cylindricity using a design ideal for machining of thin-wall parts and stop holes.



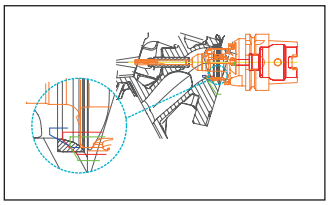
■ Specifications for Finishing of Hydraulic Lash Adjuster (HLA) Holes

	Machine : Horizontal Machining Centre	
Cutting Conditions	Spindle Speed (min^{-1})	5,000
	Feed Rate (mm/rev)	0.34
	Feed Rate (mm/min)	1,540
	Stock Removal (mm/diameter)	0.5
	Coolant	Emulsion-type water-soluble oil

Process 3 Finishing of Intake and Exhaust Valve Guide Holes



Unique guide shape and effective oil hole design enable high accuracy and high efficiency machining of deep holes with L/D of 10 or more to be achieved.



Machined Part

■ Finishing of Intake and Exhaust Valve Guide Holes

	Machine : Horizontal Machining Centre	
Cutting Conditions	Spindle Speed (min^{-1})	5,000
	Feed Rate (mm/rev)	0.3

Tool	Tool Life (No. of Holes)	Price Ratio	Cost Ratio	Coaxiality	Inner Diameter Variance
Cemented Carbide	1,200	1	1	—	—
A.L.M.T. PCD Tool	12,000	3	0.8	10 µm	3 µm/10,000 holes

PCD Rotating Tools

PCD Rotating Tools (Applications)

Features

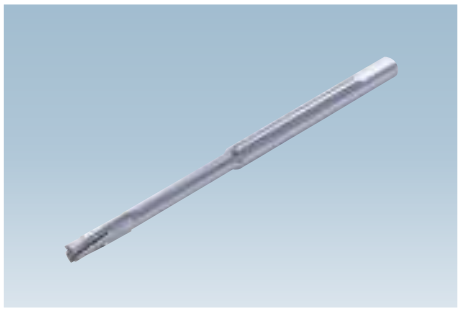
- Tools suitable for particular usage conditions, utilising analysis of structure/fluids/chips, etc.
- Support for special specifications such as mono-block tools and integrated tools.

Applications

- Drilling holes into sliding parts of valve guides or hydraulic control valves

■ Multi-Blade Multi-Stage Reamer

■ Gun Reamer



■ Irregular Pitch Reamer

■ Endmill (Ballnose Endmill)

■ Mono-block Tool
(Multi-Blade Multi-Stage Reamer)

■ Mono-block Tool
(Face Milling Cutter)

■ Integrated Tool (Reamer + Cutter)

■ Integrated Tool (Reamer + Tap)

Index O

O1 to O6

Index Reference Guide

- **The catalog numbers in this index are listed in alphabetical order.**
- **Catalogue number markings:**
  - ● **mark: Represents a numeral**

    (Example: APG4●●●R → APG4160R)

  - ■ **mark: Represents an alphabetical character**

    (Example: C●●■-SCLCR●● → C08H-SCLCR06)

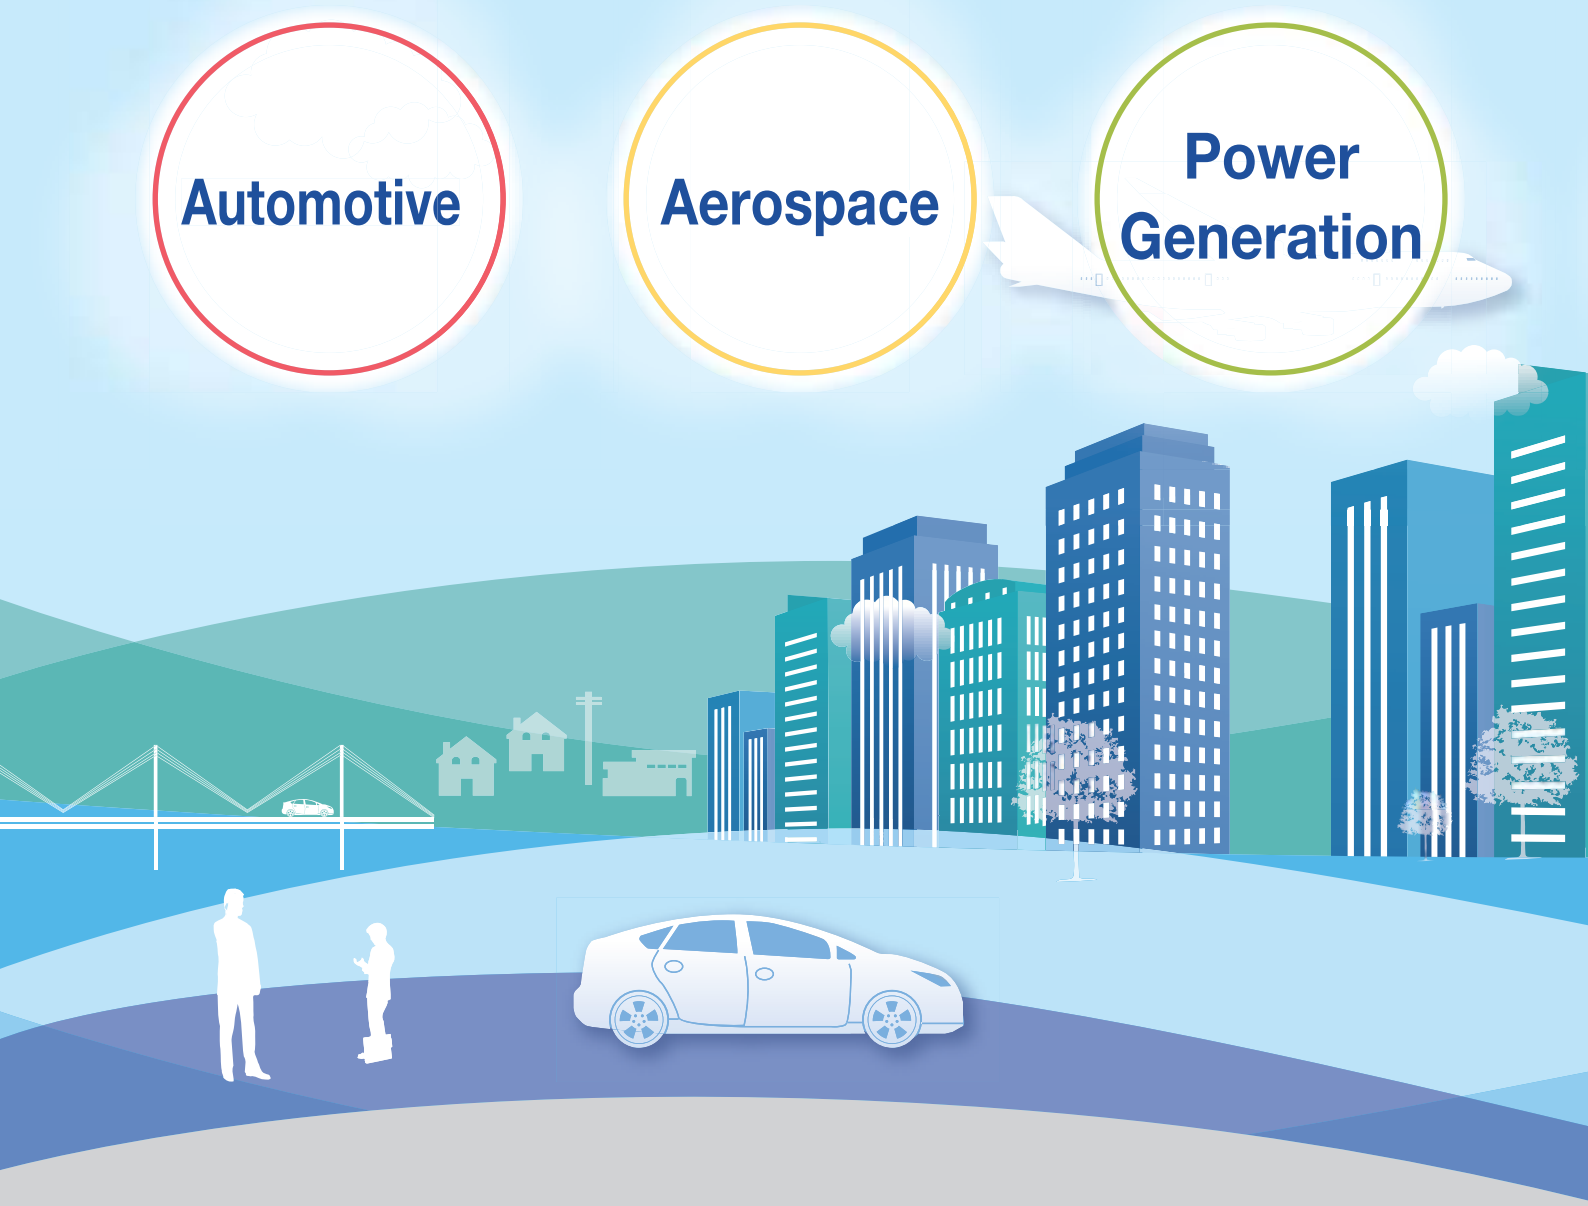
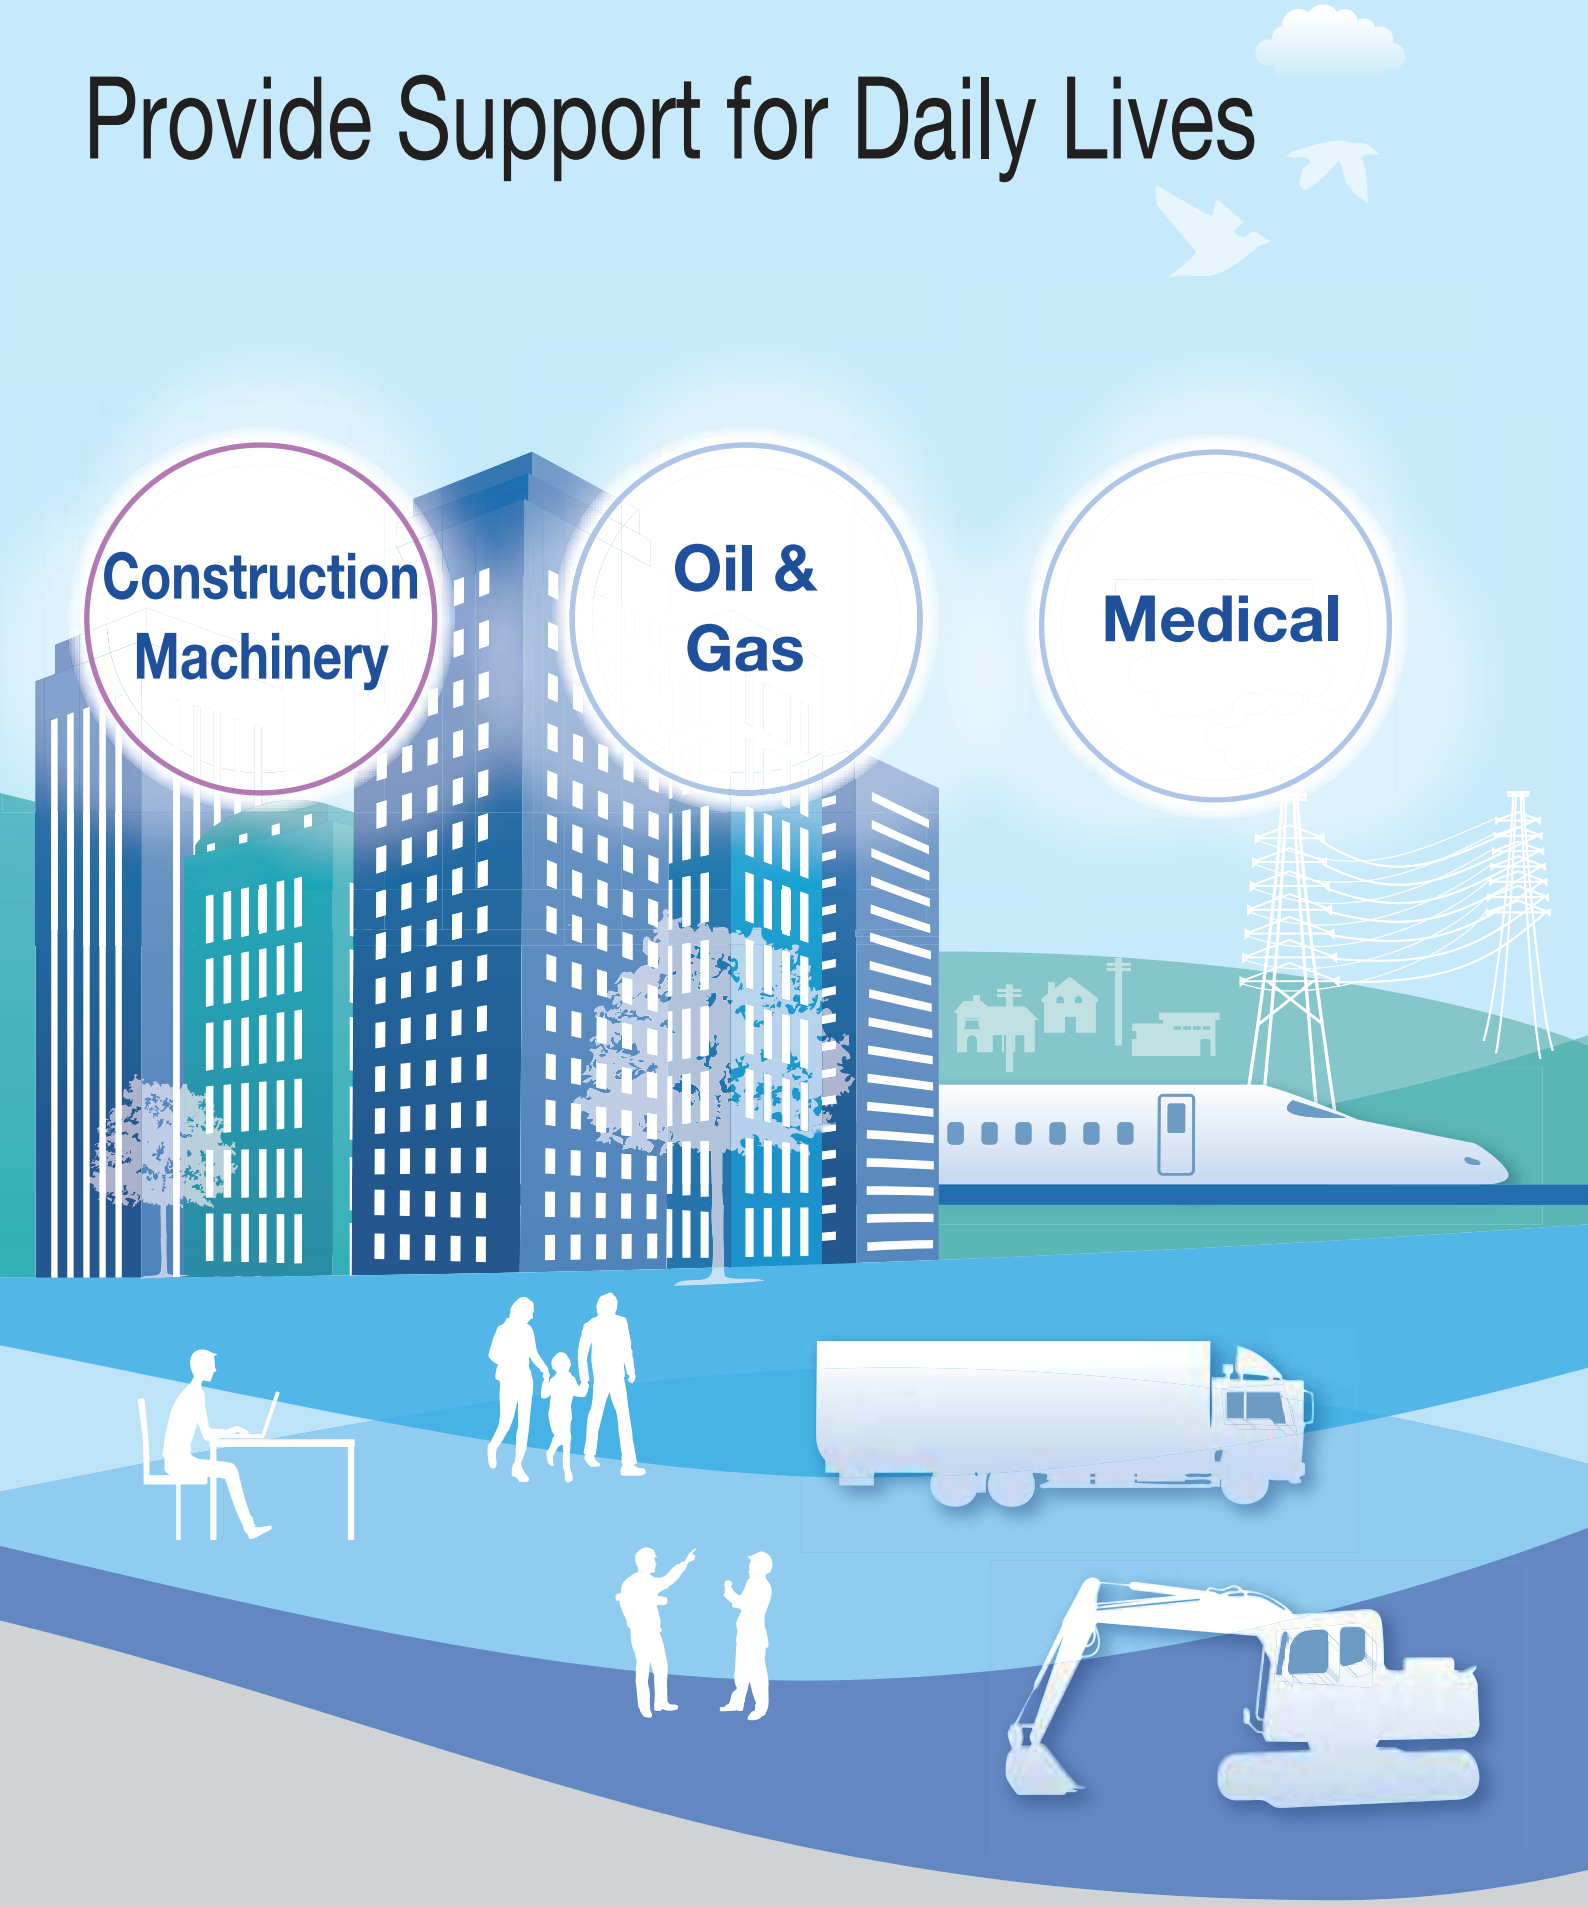
Sumitomo's Innovative Tools

Sumitomo Electric promises to understand the needs of our customers and use outstanding creativity to provide excellent products and services that are safe, socially useful and satisfy the needs of all of our customers, including quality and affordability, while also supporting people's daily lives.



Provide Support for Daily Lives



Carbide Tool Product Safety Pamphlet / Cutting Tool Edition

Sumitomo Electric Hardmetal pursues product manufacturing with a focus on both quality and safety.
Take note of each of the following points when using IGETALLOY, SUMIBORON or SUMIDIA products for safe use.

1. Carbide Tool Product Usage

Be sure to read this pamphlet thoroughly before handling or using any kind of carbide tool product or carbide tool material. Furthermore, as part of your employee safety training, make sure that all staff are well aware of the contents of this pamphlet.

2. Basic Characteristics of Carbide Tool Materials

2-1. Understanding the Terminology in this Pamphlet

Carbide Tool Material: Overall name for tool materials such as cemented carbide, cermet, ceramics, CBN, and polycrystalline diamond.
Cemented Carbide: Tool material using WC (tungsten carbide) as the main constituent
Carbide: Nickname for carbide tool materials. In a narrow sense, it is used as an abbreviation of cemented carbide.
Carbide Tool: Overall name for tools that use carbide tool materials

2-2. Physical Characteristics

Appearance: Depends on the material. Ex: Gray, black, gold, etc.
Smell: Odourless
Hardness: Carbide / cermet Hv5 to 30GPa, ceramics Hv10 to 40GPa
CBN Hv20 to 50GPa, polycrystalline diamond Hv80 to 120GPa
Specific Gravity: Carbide 9 to 16, cermet 5 to 9, ceramics 2 to 7, CBN and polycrystalline diamond 3 to 5

2-3. Constituents

Carbides, nitrides, carbon nitrides and oxides of W, Ti, Al, Si, Ta, and B, in addition to alloys containing Co, Ni, Cr, Mo and other constituents.

3. Precautionary Notes for Handling Carbide Tool Materials

- While carbide materials are extremely hard, they also possess characteristics of brittle materials. Accordingly, they may break if subjected to shock or if excessive tightening force is applied.
- Carbide materials have a high specific gravity: if the product is large or there are many items, they should be handled carefully as heavy items.
- Carbide materials have a different rate of thermal expansion from metal materials. Therefore, if the operating temperature is much higher (or lower) than the designed value, hot-fit/cool-fit (shrink fit) tools may crack.
- Carbide materials may corrode in liquids such as grinding fluid or lubricant, decreasing the strength of the tool. Consequently, store them with care.

4. Precautionary Notes on the Use of Carbide Tools

- The strength of carbide tools can be drastically reduced if the surface shape is changed. Always use a diamond grindstone for finishing.
- Carbide tools generate cutting dust when cutting. There may be harmful physical effects if a large amount is inhaled. Install a ventilation device and wear a protective mask and gloves when using the tool. If the dust gets on the skin or in the eyes, immediately wash out and rinse with water.
- If discarding lubricant used when grinding carbide materials or brazed products, the liquid will contain heavy metal constituents and should be discarded appropriately.
- When regrinding a carbide tool, check that no cracks have formed after regrinding is complete.
- Cracks may form if attempting to mark carbide materials and products with a laser or electric pen. Make sure areas where stress is applied are not marked.
- Residual cracks will form on the surface if electrical discharge machining carbide materials, decreasing the strength. If EDM is required, completely grind away these cracks.
- If brazing carbide materials, take care as if the temperature of the brazing material is too hot or too cold the carbide may come loose or become damaged.

■ Precautionary Notes on the Use of Cutting Tools

Product Line	Dangers	Countermeasures
General Cutting Tools	◎ As the tools have sharp cutting edges, you may cut your hands if they come into direct contact with the edges.	* Please use gloves and other protective gear, especially when removing a product from its case or mounting it onto a machine.
	◎ Incorrect use or inappropriate application conditions could result in injuries caused by tool breakage or projectiles.	* Use safety covers, safety glasses and other protection measures. * Always operate within recommended conditions. Please refer to the instruction manuals or catalogues.
	◎ If there is a sharp increase in cutting force due to high impact loads or excessive wear, injuries may result from tool breakage or projectiles.	* Use safety covers, safety glasses and other protection measures. * Replace the tools before the indicated product lifetimes expire.
	◎ High temperature chips or lengthy chips being discharged may cause injuries or burns.	* Use safety covers, safety glasses and other protection measures. * When clearing chips, please wear safety gloves and use an appropriate tool.
	◎ Both the tool and work material will heat up during machining. Burns may occur if touched with bare hands immediately after machining operations.	* Use gloves and other protective measures, especially when removing products from their cases.
	◎ Chips may ignite or catch fire from sparks during machining or from heat produced from breakage.	* Please do not use this product in places where there are highly flammable or highly explosive materials. * If non-water-soluble coolant is used, precautions against fire must be taken beforehand.
	◎ At high rotational speeds, injuries may result from tool breakage if the cutter (including the machine tool jig) is not balanced or if there is runout vibration.	* Use safety covers, safety glasses and other protection measures. * Please perform a dry run to ensure that there is no vibration or abnormal noises.
	◎ Burrs formed on workpieces are sharp and may cause injuries.	* Do not handle with bare hands.
General Indexable Insert Tools	◎ If inserts or holder parts are not clamped properly, they may drop off or be flung out during machining.	* Remove any foreign particles and clean all contact and clamping parts before mounting the inserts. * Check that inserts and parts have been properly clamped for mounting. Use wrenches provided for securing. Do not use inserts or parts not specified by the manufacturer.
	◎ Using pipes to aid tightening may cause insert or tool breakage as a result of over tightening.	* Do not use tightening aids such as pipes, etc. Use the included wrench.
	◎ The use of tools at high speeds is dangerous, as inserts may be flung out due to centrifugal force. Take extra care when handling very small drills.	* Always operate within recommended conditions. Please refer to the instruction manuals or catalogues.
Milling Cutters	◎ As the cutters have sharp cutting edges, you may cut your hands if they come into direct contact with the edges.	* Please use gloves and other protective measures, especially when removing products from their cases.
	◎ Injuries may result from tool breakage or projectiles if there is rotational imbalance in the cutter, which causes wobbling or vibrations.	* Rotational speeds should be kept within recommended conditions. * Regular maintenance should be performed to maintain the rotational balance and accuracy of the machine's spindle bearings. Worn bearings will lead to rotational imbalance and runout.
Drills	◎ When using rotary tools to perform through hole drilling, disc-shaped chips may be flung out at high speeds. Be careful, as the disc has extremely sharp edges.	* Use safety covers, safety glasses and other protection measures. A cover must also be mounted on the chuck.
	◎ Drills with very small diameters have sharp tips and will prick the fingers. Surgery will be required if the drills break inside the finger. Drills may also scatter when fractured. Drills may also scatter shards when fractured.	* Take extra care when handling very small drills. Use gloves and other protective gear such as safety glasses.
Brazed Tools	◎ Injuries may result from a dislodged insert or from tool breakage.	* Please ensure that tools have been properly brazed before use. * Please do not use the product under high-temperature conditions.
Others	◎ Tools that have been repeatedly brazed run a risk of breaking easily while in use.	* Do not use tools that have been brazed repeatedly, as their strength will be lowered.
	◎ There is a danger of breakages and even injuries if machines and tools are used for applications other than their intended uses.	* Always conform to the regulations specified for intended use.

Closing Notes

The content of this pamphlet covers only basic instructions for precautionary measures. For more details, please refer to the specific instruction manual and catalogue of the respective tools or contact us directly.
Sumitomo Electric Hardmetal Corp. shall not be liable for any injuries sustained from any unauthorised modifications made to the original tool specifications.
